# VS1002d - MP3 AUDIO CODEC

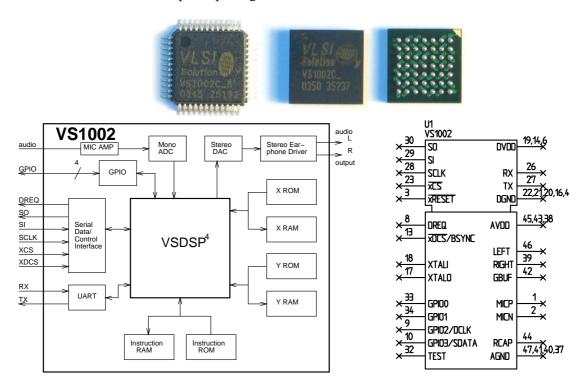

#### **Features**

- Decodes MPEG 1.0 & 2.0 audio layer III (CBR + VBR); WAV and PCM files
- Encodes ADPCM from microphone input
- Streaming support for MP3 and WAV
- Bass control
- Operates with single a clock 12..13 MHz or 24..26 MHz.
- Internal clock doubler
- Low-power operation
- High-quality on-chip stereo DAC with no phase error between channels
- Stereo earphone driver capable of driving a  $30\Omega$  load
- Separate 2.5 V..3.6 V operating voltages for analog and digital
- 7.5 KiB On-chip RAM for user code / data
- Serial control and data interfaces
- Can be used as a slave co-processor
- SPI flash boot for special applications
- UART for debugging purposes
- New functions may be added with software and 4 GPIO pins
- Lead-free RoHS-compliant packages

# **Description**

VS1002d is a single-chip MP3 audio decoder. It contains a high-performance, low-power DSP processor core VS\_DSP<sup>4</sup>, working data memory, 5 KiB instruction RAM and 2.5 KiB data RAM for user applications, serial control and input data interfaces, 4 general purpose I/O pins, an UART, as well as a high-quality variable-sample-rate mono ADC and stereo DAC, followed by an earphone amplifier and a ground buffer.

VS1002d receives its input bitstream through a serial input bus, which it listens to as a system slave. The input stream is decoded and passed through a digital volume control to an 18-bit oversampling, multi-bit, sigma-delta DAC. The decoding is controlled via a serial control bus. In addition to the basic decoding, it is possible to add application specific features, like DSP effects, to the user RAM memory.

Version 1.0, 2005-04-27

# **Characteristics & Specifications**

# 4.1 Absolute Maximum Ratings

Parameter	Symbol	Min	Max	Unit
Analog Positive Supply	AVDD	-0.3	3.6	V
Digital Positive Supply	DVDD	-0.3	3.6	V
Current at Any Digital Output			±50	mA
Voltage at Any Digital Input <sup>2</sup>		-0.3	DVDD+0.3 <sup>1</sup>	V
Operating Temperature		-40	+85	°C
Storage Temperature		-65	+150	°C

# 4.2 Recommended Operating Conditions

Parameter	Symbol	Min	Тур	Max	Unit
Ambient Operating Temperature		-40		+85	°C
Analog and Digital Ground <sup>1</sup>	AGND DGND		0.0		V
Positive Analog	AVDD	2.5	2.7	3.6	V
Positive Digital	DVDD	2.3	2.7	3.6	V
Input Clock Frequency	XTALI	24	24.576	26	MHz
Input Clock Frequency, with clock doubler	XTALI	12	12.288	13	MHz
Internal Clock Frequency	CLKI	$24^{2}$	24.576	26	MHz
Internal Clock Frequency, DVDD>= 2.7V	CLKI	$24^{2}$		28.636	MHz
Master Clock Duty Cycle		40	50	60	%

<sup>&</sup>lt;sup>1</sup> Must be connected together as close to the device as possible for latch-up immunity.

Thus, if CLKI is 24 MHz, 48 kHz is played 2.5% off-pitch.

 $<sup>^{1}</sup>$  Must not exceed 3.6 V  $^{2}$  Current must be limited to  $\pm50\,\mathrm{mA}$ 

<sup>&</sup>lt;sup>2</sup> The maximum sample rate that can be played with correct speed is CLKI/512.

#### 4.3 **Analog Characteristics**

Unless otherwise noted: AVDD=2.5..3.6V, DVDD=2.3..3.6V, TA=-40..+85°C, XTALI=12..13MHz, internal Clock Doubler active. DAC tested with 1307.894 Hz full-scale output sinewave, measurement bandwidth 20..20000 Hz, analog output load: LEFT to GBUF  $30\Omega$ , RIGHT to GBUF  $30\Omega$ . Microphone test amplitude 100 mVpp, f=1 kHz.

Parameter	Symbol	Min	Тур	Max	Unit
DAC Resolution			18		bits
Total Harmonic Distortion	THD		0.1	0.2	%
Dynamic Range (DAC unmuted, A-weighted)	IDR		90		dB
S/N Ratio (full scale signal)	SNR	70	85		dB
Interchannel Isolation (Cross Talk), AC-coupled		50	75		dB
Interchannel Isolation (Cross Talk), with GBUF			40		dB
Interchannel Gain Mismatch		-0.5		0.5	dB
Frequency Response 20 Hz15000 Hz		-0.2		0.2	dB
Frequency Response 15000 Hz19000 Hz		-1.0		-0.2	dB
Full Scale Output Voltage (Peak-to-peak)		1.4	$1.6^{1}$	2.0	Vpp
Deviation from Linear Phase				5	0
Analog Output Load Resistance	AOLR	16	$30^{2}$		Ω
Analog Output Load Capacitance				100	pF
Microphone input impedance			100		kΩ
Microphone input amplitude			$100^{3}$	280	mVpp AC
Microphone Total Harmonic Distortion	MTHD		0.03	0.10	%
Microphone S/N Ratio	MSNR	70	82		dB

<sup>&</sup>lt;sup>1</sup> 3.2 volts can be achieved with +-to-+ wiring for mono difference sound.

### 4.4 Power Consumption

Average current tested with an MPEG 1.0 Layer III 128 kbit/s sample and generated sine, output at full volume, XTALI = 12.288 MHz, internal clock doubler enabled, DVDD = 2.7 V, AVDD = 2.7 V.

Parameter	Min	Тур	Max	Unit
Power Supply Consumption AVDD, Reset		0.6	5.0	$\mu$ A
Power Supply Consumption DVDD, Reset		3.7	10.0	$\mu$ A
Power Supply Consumption AVDD, sine test, $30\Omega + GBUF$		22	30	mA
Power Supply Consumption DVDD, sine test		9	18	mA
Power Supply Consumption AVDD, no load		6		mA
Power Supply Consumption AVDD, output load $30\Omega$		10		mA
Power Supply Consumption AVDD, $30\Omega + GBUF$		16		mA
Power Supply Consumption DVDD		19		mA

<sup>&</sup>lt;sup>2</sup> AOLR may be much lower, but below *Typical* distortion performance may be compromised.

<sup>&</sup>lt;sup>3</sup> 100 mVpp is optimum level. Above typical amplitude the Harmonic Distortion increases.

# 4.5 Digital Characteristics

Parameter	Symbol	Min	Тур	Max	Unit
High-Level Input Voltage		$0.7 \times DVDD$		DVDD+0.3 <sup>1</sup>	V
Low-Level Input Voltage		-0.2		$0.3 \times \text{DVDD}$	V
High-Level Output Voltage at $I_O = -2.0 \text{ mA}$		$0.7 \times DVDD$			V
Low-Level Output Voltage at $I_O = 2.0 \text{ mA}$				$0.3 \times \text{DVDD}$	V
Input Leakage Current		-1.0		1.0	$\mu$ A
SPI Input Clock Frequency <sup>2</sup>				$\frac{CLKI}{6}$	MHz
Rise time of all output pins, load = 50 pF				50	ns

# 4.6 Switching Characteristics - Boot Initialization

Parameter	Symbol	Min	Max	Unit
XRESET active time		2		XTALI
XRESET inactive to software ready			$50000^{1}$	XTALI
Power on reset, rise time of DVDD		10		V/s

<sup>&</sup>lt;sup>1</sup> DREQ rises when initialization is complete. You should not send any data or commands before that.

 $<sup>^1</sup>$  Must not exceed 3.6V  $^2$  Value for SCI reads. SCI and SDI writes allow  $\frac{CLKI}{4}.$ 

# 5 Packages and Pin Descriptions

### 5.1 Packages

Both LPQFP-48 and BGA-49 are lead (Pb) free and also RoHS compliant packages. RoHS is a short name of *Directive 2002/95/EC on the restriction of the use of certain hazardous substances in electrical and electronic equipment.* 

#### 5.1.1 LQFP-48

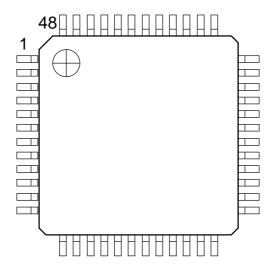

Figure 1: Pin Configuration, LQFP-48.

LQFP-48 package dimensions are at http://www.vlsi.fi/.

#### 5.1.2 BGA-49

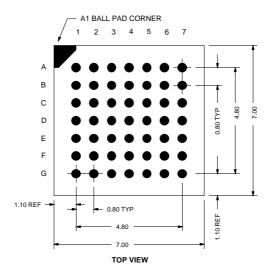

Figure 2: Pin Configuration, BGA-49.

BGA-49 package dimensions are at http://www.vlsi.fi/.

# 5.2 LQFP-48 and BGA-49 Pin Descriptions

Pin Name	LQFP-	BGA49	Pin	Function
	48 Pin	Ball	Type	
MICP <sup>2</sup>	1	C3	AI	microphone input, use pull-down resistor if not used
MICN <sup>2</sup>	2	C2	AI	microphone input, use pull-down resistor if not used
XRESET	3	B1	DI	active low asynchronous reset
DGND0	4	D2	PWR	digital ground
DVDD0	6	D3	PWR	digital power supply
DREQ	8	E2	DO	data request output
GPIO2 <sup>2</sup> / DCLK <sup>1</sup>	9	E1	DI	general purpose IO 2 / serial input data bus clock, use pull-down resistor if not used
GPIO3 <sup>2</sup> / SDATA <sup>1</sup>	10	F2	DI	general purpose IO 3 / serial data input, use pull-down resistor if not used
XDCS / BSYNC <sup>1</sup>	13	E3	DI	data chip select / byte sync
DVDD1	14	F3	PWR	digital power supply
DGND1	16	F4	PWR	digital ground
XTALO	17	G3	AO	crystal output
XTALI	18	E4	AI	crystal input
DVDD2	19	F5	PWR	digital power supply
DGND2	20	F6	PWR	digital ground (in BGA-49, DGND2, 3, 4 conn. together)
DGND3	21	F6	PWR	digital ground
DGND4	22	F6	PWR	digital ground
XCS	23	G6	DI	chip select input (active low)
RX	26	E6	DI	UART receive, use pull-up resistor if not used
TX	27	F7	DO	UART transmit
SCLK	28	D6	DI	clock for serial bus
SI	29	E7	DI	serial input
SO	30	D5	DO3	serial output
TEST	32	C6	DI	reserved for test, connect to DVDD
SPIBOOT/GPIO0 <sup>3</sup>	33	C7	DIO	general purpose IO 0, use 100 kΩ pull-down resistor
GPIO1 <sup>2</sup>	34	B6	DIO	general purpose IO 1, use pull-down resistor if not used
AGND0	37	C5	PWR	analog ground, low-noise reference
AVDD0	38	B5	PWR	analog power supply
RIGHT	39	A6	AO	right channel output
AGND1	40	B4	PWR	analog ground
AGND2	41	A5	PWR	analog ground
GBUF	42	C4	AO	virtual ground for audio output, 1.23 V nominal
AVDD1	43	A4	PWR	analog power supply
RCAP	44	В3	AIO	filtering capacitance for reference
AVDD2	45	A3	PWR	analog power supply
LEFT	46	B2	AO	left channel output
AGND3	47	A2	PWR	analog ground

<sup>&</sup>lt;sup>1</sup> First pin function is active in New Mode, latter in Compatibility Mode.

<sup>&</sup>lt;sup>3</sup> Unless pull-down resistor is used, SPI Boot is tried. See Chapter 9.4 for details.

Type	Description
DI	Digital input, CMOS Input Pad
DO	Digital output, CMOS Input Pad
DIO	Digital input/output
DO3	Digital output, CMOS Tri-stated Output Pad

Type	Description
AI	Analog input
AO	Analog output
AIO	Analog input/output
PWR	Power supply pin

In BGA-49, no-connect balls are A1, A7, B7, C1, D1, D4, D7, E5, F1, G1, G2, G7.

In LQFP-48, no-connect pins are 5, 7, 11, 12, 15, 24, 25, 31, 35, 36, 48.

 $<sup>^2</sup>$  If not used, use 100  $k\Omega$  pull-down resistor.

# 6 Connection Diagram, LQFP-48

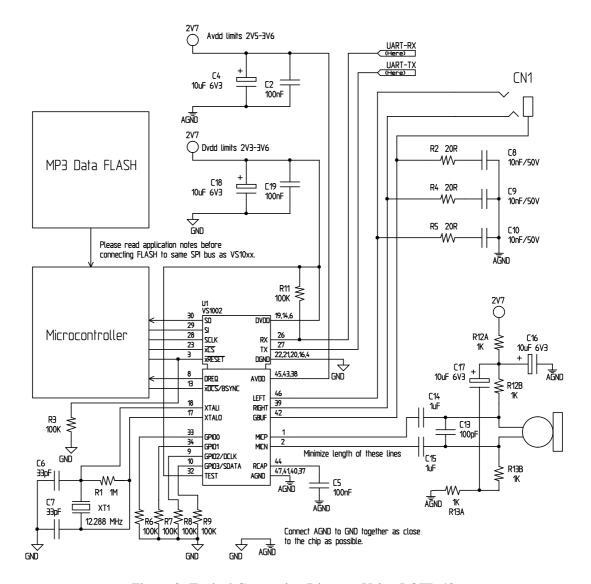

Figure 3: Typical Connection Diagram Using LQFP-48.

The ground buffer GBUF can be used for common voltage (1.23 V) for earphones. This will eliminate the need for large isolation capacitors on line outputs, and thus the audio output pins from VS1002d may be connected directly to the earphone connector.

If GBUF is not used, LEFT and RIGHT must be provided with 1-100  $\mu$ F capacitors depending load resistance.

If UART is not used, RX should connect to DVDD and TX be unconnected.

Note: This connection assumes SM\_SDINEW is active (see Chapter 8.6.1). If also SM\_SDISHARE is used, xDCS should have a pull-up resistor (see Chapter 7.2.1).

# 7 SPI Buses

#### 7.1 General

The SPI Bus - that was originally used in some Motorola devices - has been used for both VS1002d's Serial Data Interface SDI (Chapters 7.4 and 8.4) and Serial Control Interface SCI (Chapters 7.5 and 8.5).

# 7.2 SPI Bus Pin Descriptions

#### 7.2.1 VS1002 Native Modes (New Mode)

These modes are active when SM\_SDINEW is set to 1 (default at startup). DCLK, SDATA and BSYNC are replaced with GPIO2, GPIO3 and XDCS, respectively.

SDI Pin	SCI Pin	Description							
XDCS	XCS	Active low chip select input. A high level forces the serial interface into							
		standby mode, ending the current operation. A high level also forces serial							
		output (SO) to high impedance state. If SM_SDISHARE is 1, pin							
		XDCS is not used, but the signal is generated internally by inverting							
		XCS.							
SC	CK	Serial clock input. The serial clock is also used internally as the master							
		clock for the register interface.							
		SCK can be gated or continuous. In either case, the first rising clock edge							
		after XCS has gone low marks the first bit to be written.							
S	I	Serial input. If a chip select is active, SI is sampled on the rising CLK edge.							
-	SO	Serial output. In reads, data is shifted out on the falling SCK edge.							
		In writes SO is at a high impedance state.							

## 7.2.2 VS1001 Compatibility Mode

This mode is active when SM\_SDINEW is set to 0. In this mode, DCLK, SDATA and BSYNC are active.

SDI Pin	SCI Pin	Description
-	XCS	Active low chip select input. A high level forces the serial interface into
		standby mode, ending the current operation. A high level also forces serial
		output (SO) to high impedance state. There is no chip select for SDI, which
		is always active.
BSYNC	-	SDI data is synchronized with a rising edge of BSYNC.
DCLK	SCK	Serial clock input. The serial clock is also used internally as the master
		clock for the register interface.
		SCK can be gated or continuous. In either case, the first rising clock edge
		after XCS has gone low marks the first bit to be written.
SDATA	SI	Serial input. SI is sampled on the rising SCK edge, if XCS is low.
-	SO	Serial output. In reads, data is shifted out on the falling SCK edge.
		In writes SO is at a high impedance state.

### 7.3 Data Request Pin DREQ

The DREQ pin/signal is used to signal if VS1002d's FIFO is capable of receiving data. If DREQ is high, VS1002d can take at least 32 bytes of SDI data or one SCI command. When these criteria are not met, DREQ is turned low, and the sender should stop transferring new data.

Because of the 32-byte safety area, the sender may send upto 32 bytes of SDI data at a time without checking the status of DREQ, making controlling VS1002d easier for low-speed microcontrollers.

Note: DREQ may turn low or high at any time, even during a byte transmission. Thus, DREQ should only be used to decide whether to send more bytes. It should not abort a transmission that has already started.

#### 7.4 Serial Protocol for Serial Data Interface (SDI)

#### 7.4.1 General

The serial data interface operates in slave mode so the DCLK signal must be generated by an external circuit.

Data (SDATA signal) can be clocked in at either the rising or falling edge of DCLK (Chapter 8.6).

VS1002d assumes its data input to be byte-sychronized. SDI bytes may be transmitted either MSb or LSb first, depending of contents of SCI\_MODE (Chapter 8.6.1).

The firmware is able to accept the maximum bitrate the SDI supports.

#### 7.4.2 SDI in VS1002 Native Modes (New Mode)

In VS1002 native modes, byte synchronization is achieved by XDCS (or XCS if SM\_SDISHARE is 1). The state of XDCS (or XCS) may not change while a data byte transfer is in progress. To always maintain data synchronization even if there may be glitches in the boards using VS1002d, it is recommended to turn XDCS (or XCS) every now and then, for instance once after every flash data block or a few kilobytes, just to keep sure the host and VS1002d are in sync.

If SM\_SDISHARE is 1, the XDCS signal is internally generated by inverting the XCS input.

For new designs, using VS1002 native modes are recommended.

#### 7.4.3 SDI in VS1001 Compatibility Mode

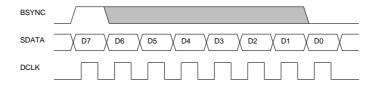

Figure 4: BSYNC Signal - one byte transfer.

When VS1002d is running in VS1001 compatibility mode, a BSYNC signal must be generated to ensure correct bit-alignment of the input bitstream. The first DCLK sampling edge (rising or falling, depending on selected polarity), during which the BSYNC is high, marks the first bit of a byte (LSB, if LSB-first order is used, MSB, if MSB-first order is used). If BSYNC is '1' when the last bit is received, the receiver stays active and next 8 bits are also received.

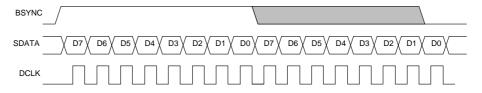

Figure 5: BSYNC Signal - two byte transfer.

#### 7.5 Serial Protocol for Serial Command Interface (SCI)

#### 7.5.1 General

The serial bus protocol for the Serial Command Interface SCI (Chapter 8.5) consists of an instruction byte, address byte and one 16-bit data word. Each read or write operation can read or write a single register. Data bits are read at the rising edge, so the user should update data at the falling edge. Bytes are always send MSb firrst.

The operation is specified by an 8-bit instruction opcode. The supported instructions are read and write. See table below.

Instruction											
Name	Opcode	Operation									
READ	0b0000 0011	Read data									
WRITE	0b0000 0010	Write data									

Note: After sending an SCI command, it is not allowed to send SCI or SDI data for 5 microseconds.

#### 7.5.2 SCI Read

VS1002d registers are read by the following sequence, as shown in Figure 6. First, XCS line is pulled low to select the device. Then the READ opcode (0x3) is transmitted via the SI line followed by an 8-bit word address. After the address has been read in, any further data on SI is ignored. The 16-bit data corresponding to the received address will be shifted out onto the SO line.

XCS should be driven high after data has been shifted out.

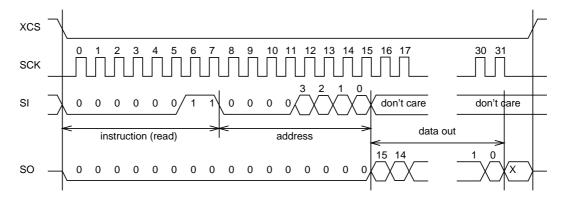

Figure 6: SCI Word Read

#### 7.5.3 SCI Write

VS1002d registers are written to using the following sequence, as shown in Figure 7. First, XCS line is pulled low to select the device. Then the WRITE opcode (0x2) is transmitted via the SI line followed by an 8-bit word address.

After the word has been shifted in and the last clock has been sent, XCS should be pulled high to end the WRITE sequence.

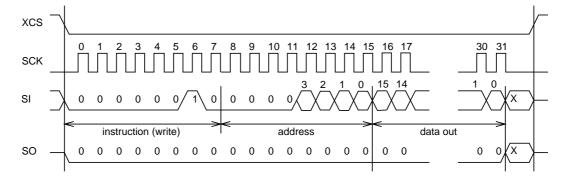

Figure 7: SCI Word Write

# 7.6 SPI Timing Diagram

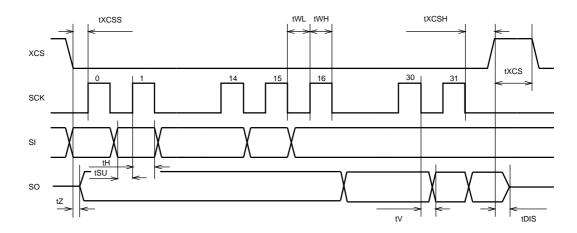

Figure 8: SPI Timing Diagram.

Symbol	Min	Max	Unit
tXCSS	5		ns
tSU	-26		ns
tH	2		XTALI cycles
tZ	0		ns
tWL	2		XTALI cycles
tWH	2		XTALI cycles
tV		$2 (+ 25 \text{ns}^1)$	XTALI cycles
tXCSH	-26		ns
tXCS	2		XTALI cycles
tDIS		10	ns

<sup>&</sup>lt;sup>1</sup> 25ns is when pin loaded with 100pF capacitance. The time is shorter with lower capacitance.

Note: As tWL and tWH, as well as tH require at least 2 clock cycles, the maximum speed for the SPI bus that can easily be used is 1/6 of VS1011's external clock speed XTALI. Slightly higher speed can be achieved with very careful timing tuning. For details, see Application Notes for VS10XX.

Note: Negative numbers mean that the signal can change in different order from what is shown in the diagram.

# 7.7 SPI Examples with SM\_SDINEW and SM\_SDISHARED set

#### 7.7.1 Two SCI Writes

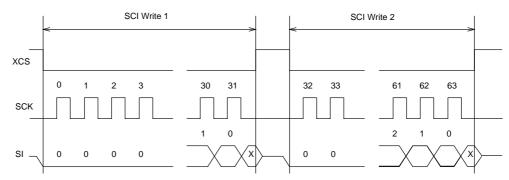

Figure 9: Two SCI Operations.

Figure 9 shows two consecutive SCI operations. Note that xCS *must* be raised to inactive state between the writes.

#### 7.7.2 Two SDI Bytes

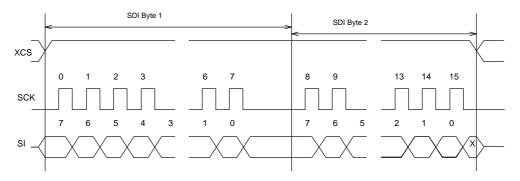

Figure 10: Two SDI Bytes.

SDI data is synchronized with a raising edge of xCS as shown in Figure 10. However, every byte doesn't need separate synchronization.

#### 7.7.3 SCI Operation in Middle of Two SDI Bytes

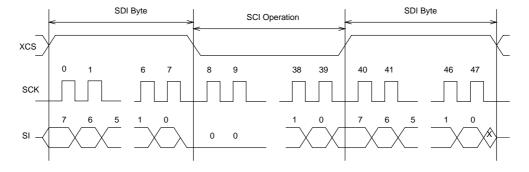

Figure 11: Two SDI Bytes Separated By an SCI Operation.

Figure 11 shows how an SCI operation is embedded in between SDI operations. The changes in xCS are used to synchronize both SDI and SCI.

# **8 Functional Description**

#### 8.1 Main Features

VS1002d is based on a proprietary digital signal processor, VS\_DSP. It contains all the code and data memory needed for MP3 and WAV PCM + ADPCM audio decoding, together with serial interfaces, a multirate stereo audio DAC and analog output amplifiers and filters. Also ADPCM audio encoding is supported using a microphone amplifier and A/D converter. A UART is provided for debugging purposes.

VS1002d can play all MPEG 1.0 and 2.0 layer III files, with all sample rates and bitrates, including variable bitrate (VBR).

### 8.2 Supported Audio Codecs

	Conventions										
Mark	Description										
+	Format is supported										
-	Format exists but is not supported										
	Format doesn't exist										

#### 8.2.1 Supported MP3 (MPEG layer III) Formats

#### MPEG $1.0^{1}$ :

Samplerate / Hz	Bitrate / kbit/s													
	32	40	48	56	64	80	96	112	128	160	192	224	256	320
48000	+	+	+	+	+	+	+	+	+	+	+	+	+3	+3
44100	+	+	+	+	+	+	+	+	+	+	+	+	+	+3
32000	+	+	+	+	+	+	+	+	+	+	+	+	+	+

### MPEG $2.0^{1}$ :

Samplerate / Hz	Bitrate / kbit/s													
	8	16	24	32	40	48	56	64	80	96	112	128	144	160
24000	+	+	+	+	+	+	+	+	+	+	+	+	+	+
22050	+	+	+	+	+	+	+	+	+	+	+	+	+	+
16000	+	+	+	+	+	+	+	+	+	+	+	+	+	+

#### MPEG 2.5<sup>1</sup> <sup>2</sup>:

Samplerate / Hz	Bitrate / kbit/s													
	8	16	24	32	40	48	56	64	80	96	112	128	144	160
12000	+	+	+	+	+	+	+	+	+	+	+	+	+	+
11025	+	+	+	+	+	+	+	+	+	+	+	+	+	+
8000	+	+	+	+	+	+	+	+	+	+	+	+	+	+

<sup>&</sup>lt;sup>1</sup> Also all variable bitrate (VBR) formats are supported.

<sup>&</sup>lt;sup>2</sup> Incompatibilities may occur because MPEG 2.5 is not a standard format.

<sup>&</sup>lt;sup>3</sup> Nominal CLKI=24.576 MHz may be too little for glitchless playback.

#### 8.2.2 Supported RIFF WAV Formats

The most common RIFF WAV subformats are supported.

Format	Name	Supported	Comments
0x01	PCM	+	16 and 8 bits, any sample rate ≤ 48kHz
0x02	ADPCM	-	
0x03	IEEE_FLOAT	-	
0x06	ALAW	-	
0x07	MULAW	-	
0x10	OKI_ADPCM	-	
0x11	IMA_ADPCM	+	Any sample rate $\leq 48$ kHz, mono only
0x15	DIGISTD	-	
0x16	DIGIFIX	-	
0x30	DOLBY_AC2	-	
0x31	GSM610	-	
0x3b	ROCKWELL_ADPCM	-	
0x3c	ROCKWELL_DIGITALK	-	
0x40	G721_ADPCM	-	
0x41	G728_CELP	-	
0x50	MPEG	-	
0x55	MPEGLAYER3	+	For supported MP3 modes, see Chapter 8.2.1
0x64	G726_ADPCM	-	
0x65	G722_ADPCM	-	

#### 8.3 Data Flow of VS1002d

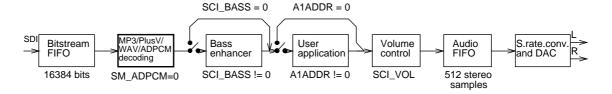

Figure 12: Data Flow of VS1002d.

First, depending on the audio data, and provided ADPCM encoding mode is not set, MP3, PCM WAV or mono IMA ADPCM WAV data is received and decoded from the SDI bus.

After decoding, data may be sent to the Bass Enhancer depending on SCI\_BASS.

Then, if SCI\_AIADDR is non-zero, application code is executed from the address pointed to by that register. For more details, see Application Notes for VS10XX.

After the optional user application, the signal is fed to the volume control unit, which also copies the data to the Audio FIFO.

The Audio FIFO holds the data, which is read by the Audio interrupt (Chapter 10.13.1) and fed to the sample rate converter and DACs. The size of the audio FIFO is 512 stereo ( $2 \times 16$ -bit) samples.

The sample rate converter converts all different sample rates to CLKI/512 and feeds the data to the DAC,

which in order creates a stereo in-phase analog signal. This signal is then forwarded to the earphone amplifier.

### 8.4 Serial Data Interface (SDI)

The serial data interface is meant for transferring compressed MP3 audio data as well as WAV PCM and ADPCM data.

If the input of the decoder is invalid or it is not received fast enough, analog outputs are automatically muted.

Also several different tests may be activated through SDI as described in Chapter 9.

# 8.5 Serial Control Interface (SCI)

The serial control interface is compatible with the SPI bus specification. Data transfers are always 16 bits. VS1002d is controlled by writing and reading the registers of the interface.

VS1002d

The main controls of the control interface are:

- control of the operation mode
- uploading user programs
- access to header data
- status information
- access to encoded digital data

# 8.6 SCI Registers

	SCI registers, prefix SCI_, offset 0xC000				
Reg	Type	Reset	Abbrev[bits]	Description	
0x0	rw	0x800	MODE	Mode control.	
0x1	rw	$0x2C^1$	STATUS	Status of VS1002d.	
0x2	rw	0	BASS	Built-in bass enhancer.	
0x3	rw	0	CLOCKF	Clock freq + doubler.	
0x4	r	0	DECODE_TIME	Decode time in seconds.	
0x5	rw	0	AUDATA	Misc. audio data.	
0x6	rw	0	WRAM	RAM write.	
0x7	rw	0	WRAMADDR	Base address for RAM write.	
0x8	r	0	HDAT0	Stream header data 0.	
0x9	r	0	HDAT1	Stream header data 1.	
0xA	rw	0	AIADDR	Start address of application.	
0xB	rw	0	VOL	Volume control.	
0xC	rw	0	AICTRL0	Application control register 0.	
0xD	rw	0	AICTRL1	Application control register 1.	
0xE	rw	0	AICTRL2	Application control register 2.	
0xF	rw	0	AICTRL3	Application control register 3.	

<sup>&</sup>lt;sup>1</sup> Firmware changes the value of this register immediately to 0x28, and in less than 100 ms to 0x20.

#### **8.6.1 SCI\_MODE** (**RW**)

SCI\_MODE is used to control operation of VS1002d. Note that this register is not reset to 0, but to 0x0800 (i.e. SM\_SDINEW is set).

Bit	Name	Function	Value	Description
0	SM_DIFF	Differential	0	normal in-phase audio
			1	left channel inverted
1	SM_SETTOZERO	Set to zero	0	right
			1	wrong
2	SM_RESET	Soft reset	0	no reset
			1	reset
3	SM_OUTOFWAV	Jump out of WAV decoding	0	no
			1	yes
4	SM_PDOWN	Powerdown	0	power on
			1	powerdown
5	SM_TESTS	Allow SDI tests	0	not allowed
			1	allowed
6	SM_STREAM	Stream mode	0	no
			1	yes
7	SM_PLUSV	MP3+V active	0	no
			1	yes
8	SM_DACT	DCLK active edge	0	rising
			1	falling
9	SM_SDIORD	SDI bit order	0	MSb first
			1	MSb last
10	SM_SDISHARE	Share SPI chip select	0	no
			1	yes
11	SM_SDINEW	VS1002 native SPI modes	0	no
			1	yes
12	SM_ADPCM	ADPCM recording active	0	no
			1	yes
13	SM_ADPCM_HP	ADPCM high-pass filter active	0	no
			1	yes

When SM\_DIFF is set, the player inverts the left channel output. For a stereo input this creates a virtual surround, and for a mono input this effectively creates a differential left/right signal.

By setting SM\_RESET to 1, the player is software reset. This bit clears automatically.

When the user decoding a WAV file wants to get out of the file without playing it to the end, set SM\_OUTOFWAV, and send zeros to VS1002d until SM\_OUTOFWAV is again zero. If the user doesn't want to check SM\_OUTOFWAV, send 128 zeros.

Bit SM\_PDOWN sets VS1002d into software powerdown mode. During powerdown, no audio is played and no SDI operations are performed. For best results, set SCI\_VOL to 0xFFFF before activating software powerdown. Note that software powerdown is not nearly as power efficient as hardware powerdown activated with the XRESET pin.

If SM\_TESTS is set, SDI tests are allowed. For more details on SDI tests, look at Chapter 9.7.

SM\_STREAM activates VS1002d's stream mode. In this mode, data should be sent with as even intervals as possible (and preferable with data blocks of less than 512 bytes), and VS1002d makes every attempt to keep its input buffer half full by changing its playback speed upto 5%. For best quality sound, the average speed error should be within 0.5%, the bitrate should not exceed 160 kbit/s and VBR should not be used. For details, see Application Notes for VS10XX.

SM\_PLUSV activates MP3+V decoding. Without this bit set, only MP3 decoding is performed even for files with additional PlusV data.

SM\_DACT defines the active edge of data clock for SDI. If clear data is read at the rising edge, and if set data is read at the falling edge.

When SM\_SDIORD is clear, bytes on SDI are sent as a default MSb first. By setting SM\_SDIORD, the user may reverse the bit order for SDI, i.e. bit 0 is received first and bit 7 last. Bytes are, however, still sent in the default order. This register bit has no effect on the SCI bus.

Setting SM\_SDISHARE makes SCI and SDI share the same chip select, as explained in Chapter 7.2, if also SM\_SDINEW is set.

Setting SM\_SDINEW will activate VS1002 native serial modes as described in Chapters 7.2.1 and 7.4.2. Note, that this bit is set as a default when VS1002d is started up.

By activating SM\_ADPCM and SM\_RESET at the same time, the user will activate IMA ADPCM recording mode. More information is available in document Application Notes for VS10XX.

If SM\_ADPCM\_HP is set at the same time as SM\_ADPCM and SM\_RESET, ADPCM mode will start with a high-pass filter. This may help intelligibility of speech when there is lots of background noise. The difference created to the ADPCM encoder frequency response is as shown in Figure 13.

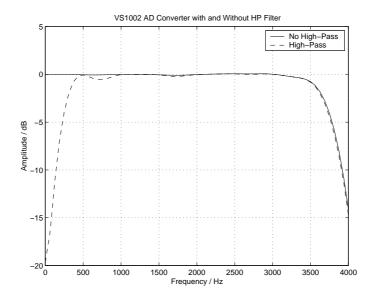

Figure 13: ADPCM Frequency Responses.

#### 8.6.2 SCI\_STATUS (RW)

SCI\_STATUS contains information on the current status of VS1002d and lets the user shutdown the chip without audio glitches.

Name	Bits	Description
SS_VER	64	Version
SS_APDOWN2	3	Analog driver powerdown
SS_APDOWN1	2	Analog internal powerdown
SS_AVOL	10	Analog volume control

SS\_VER is 0 for VS1001, 1 for VS1011, 2 for VS1002 and 3 for vs1003.

SS\_APDOWN2 controls analog driver powerdown. Normally this bit is controlled by the system firmware. However, if the user wants to powerdown VS1002d with a minimum power-off transient, turn this bit to 1, then wait for at least a few milliseconds before activating reset.

SS\_APDOWN1 controls internal analog powerdown. This bit is meant to be used by the system firmware only.

SS\_AVOL is the analog volume control: 0 = -0 dB, 1 = -6 dB, 3 = -12 dB. This register is meant to be used automatically by the system firmware only.

#### 8.6.3 **SCI\_BASS (RW)**

Name Bits		Description
SB_AMPLITUDE	74	Enhancement in 1 dB steps (015)
SB_FREQLIMIT	30	Lower limit frequency in 10 Hz steps (215)

The Bass Enhancer VSBE is a powerful bass boosting DSP algorithm, which tries to take the most out of the users earphones without causing clipping.

VSBE is activated when SB\_AMPLITUDE is set to non-zero. SB\_AMPLITUDE should be set to the user's preferences, and SB\_FREQLIMIT to roughly 1.5 times the lowest frequency the user's audio system can reproduce.

Note: Because VSBE tries to avoid clipping, it gives the best bass boost with dynamical music material, or when the playback volume is not set to maximum.

### 8.6.4 SCI\_CLOCKF (RW)

SCI\_CLOCKF is used to tell if the input clock XTALI is running at something else than 24.576 MHz. XTALI is set in 2 kHz steps. Thus, the formula for calculating the correct value for this register is  $\frac{XTALI}{2000}$  (XTALI is in Hz). Values may be between 0..32767, although hardware limits the highest allowed speed.

Also, with speeds lower than 24.576 MHz all sample rates and bitstream widths are no longer available.

Setting the MSB of SCI\_CLOCKF to 1 activates internal clock-doubling. A clock of upto 15 MHz may be doubled depending on the voltage provided to the chip.

Note: SCI\_CLOCKF must be set before beginning decoding audio data; otherwise the sample rate will not be set correctly.

Note: Unlike with VS1011, SCI\_CLOCKF only needs to be written to after a hardware reset.

Example 1: For a 26 MHz clock the value would be  $\frac{26000000}{2000} = 13000$ .

Example 2: For a 13 MHz external clock and using internal clock-doubling for a 26 MHz internal frequency, the value would be  $0x8000 + \frac{13000000}{2000} = 39268$ .

Example 3: For a 24.576 MHz clock the value would be either  $\frac{24576000}{2000} = 12288$ , or just the default value 0. For this clock frequency, SCI\_CLOCKF doesn't need to be set.

#### 8.6.5 SCI\_DECODE\_TIME (RW)

When decoding correct data, current decoded time is shown in this register in full seconds.

The user may change the value of this register. However, in that case the new value should be written twice.

SCI\_DECODE\_TIME is reset at every software reset.

#### 8.6.6 SCI\_AUDATA (RW)

When decoding correct data, the current sample rate and number of channels can be found in bits 15..1 and 0 of SCI\_AUDATA, respectively. Bits 15..1 contain the sample rate divided by two, and bit 0 is 0 for mono data and 1 for stereo. Writing to this register will change the sample rate on the run to the number given.

Example: 44100 Hz stereo data reads as 0xAC45 (44101).

#### **8.6.7** SCI\_WRAM (RW)

SCI\_WRAM is used to upload application programs and data to instruction and data RAMs. The start address must be initialized by writing to SCI\_WRAMADDR prior to the first call of SCI\_WRAM. As 16 bits of data can be transferred with one SCI\_WRAM write, and the instruction word is 32 bits long, two consecutive writes are needed for each instruction word. The byte order is big-endian (i.e. MSBs first). After each full-word write, the internal pointer is autoincremented.

SM_WRAMADDR StartEnd	Dest. addr. StartEnd	Bits/ Word	Description
0x13800x13FF	0x13800x13FF	16	X data RAM
0x47800x47FF	0x07800x07FF	16	Y data RAM
0x80300x84FF	0x00300x04FF	32	Instruction RAM

### 8.6.8 SCI\_WRAMADDR (RW)

SCI\_WRAMADDR is used to set the program address for following SCI\_WRAM writes.

VS1002d

## 8.6.9 SCI\_HDAT0 and SCI\_HDAT1 (R)

For WAV files, SPI\_HDAT0 and SPI\_HDAT1 read as 0x7761, and 0x7665, respectively.

For MP3 files, SCI\_HDAT[0...1] have the following content:

Bit	Function	Value	Explanation
HDAT1[15:5]	syncword	2047	stream valid
HDAT1[4:3]	ID	3	ISO 11172-3 1.0
		2	MPG 2.0 (1/2-rate)
		1	MPG 2.5 (1/4-rate)
		0	MPG 2.5 (1/4-rate)
HDAT1[2:1]	layer	3	I
		2	II
		1	III
		0	reserved
HDAT1[0]	protect bit	1	No CRC
		0	CRC protected
HDAT0[15:12]	bitrate		ISO 11172-3
HDAT0[11:10]	sample rate	3	reserved
		2	32/16/8 kHz
		1	48/24/12 kHz
		0	44/22/11 kHz
HDAT0[9]	pad bit	1	additional slot
		0	normal frame
HDAT0[8]	private bit		not defined
HDAT0[7:6]	mode	3	mono
		2	dual channel
		1	joint stereo
		0	stereo
HDAT0[5:4]	extension		ISO 11172-3
HDAT0[3]	copyright	1	copyrighted
		0	free
HDAT0[2]	original	1	original
		0	copy
HDAT0[1:0]	emphasis	3	CCITT J.17
		2	reserved
		1	50/15 microsec
		0	none

When read, SCI\_HDAT0 and SCI\_HDAT1 contain header information that is extracted from MP3 stream being currently being decoded. Right after resetting VS1002d, 0 is automatically written to both registers, indicating no data has been found yet.

The "sample rate" field in SCI\_HDAT0 is interpreted according to the following table:

"sample rate"	ID=3 / Hz	ID=2 / Hz	ID=0,1 / Hz
3	-	-	-
2	32000	16000	8000
1	48000	24000	12000
0	44100	22050	11025

The "bitrate" field in HDAT0 is read according to the following table:

"bitrate"	ID=3 / kbit/s	ID=0,1,2 / kbit/s
15	forbidden	forbidden
14	320	160
13	256	144
12	224	128
11	192	112
10	160	96
9	128	80
8	112	64
7	96	56
6	80	48
5	64	40
4	56	32
3	48	24
2	40	16
1	32	8
0	-	-

#### 8.6.10 SCI\_AIADDR (RW)

SCI\_AIADDR indicates the start address of the application code written earlier with SCI\_WRAMADDR and SCI\_WRAM registers. If no application code is used, this register should not be initialized, or it should be initialized to zero. For more details, see Application Notes for VS10XX.

#### 8.6.11 SCI\_VOL (RW)

SCI\_VOL is a volume control for the player hardware. For each channel, a value in the range of 0 .. 255 may be defined to set its attenuation from the maximum volume level (in 0.5 dB steps). The left channel value is then multiplied by 256 and the values are added. Thus, maximum volume is 0 and total silence if 0xFFFF. Example: for a volume of -2.0 dB for the left channel and -3.5 dB for the right channel: (4\*256) + 7 = 0x407. Note, that at startup volume is set to full volume. Resetting the software does not reset the volume setting.

Note: Setting the volume to total silence (255 for both left and right channels) will turn analog power off.

#### **8.6.12 SCI\_AICTRL**[x] (RW)

SCI\_AICTRL[x] registers (x=[0...3]) can be used to access the user's application program.

# 9 Operation

# 9.1 Clocking

VS1002d operates on a single, nominally 24.576 MHz fundamental frequency master clock. This clock can be generated by external circuitry (connected to pin XTALI) or by the internal clock chrystal interface (pins XTALI and XTALO). This clock is sufficient to support a high quality audio output for almost all standard sample rates and bit-rates (see Application Notes for VS10XX).

#### 9.2 Hardware Reset

When the XRESET -signal is driven low, VS1002d is reset and all the control registers and internal states are set to the initial values. XRESET-signal is asynchronous to any external clock. The reset mode doubles as a full-powerdown mode, where both digital and analog parts of VS1002d are in minimum power consumption stage, and where clocks are stopped. Also XTALO and XTALI are grounded.

After a hardware reset (or at power-up), the user should set such basic software registers as SCI\_VOL for volume (and SCI\_CLOCKF if the input clock is anything else than 24.576 MHz) before starting decoding.

#### 9.3 Software Reset

In some cases the decoder software has to be reset. This is done by activating bit 2 in SCI\_MODE register (Chapter 8.6.1). Then wait for at least 2  $\mu$ s, then look at DREQ. DREQ will stay down for at least 6000 clock cycles, which means an approximate 250  $\mu$ s delay if VS1002d is run at 24.576 MHz. After DREQ is up, you may continue playback as usual.

If you want to make sure VS1002d doesn't cut the ending of low-bitrate data streams and you want to do a software reset, it is recommended to feed 2048 zeros to the SDI bus after the file and before the reset.

#### 9.4 SPI Boot

If GPIO0 is set with a pull-up resistor to 1 at boot time, VS1002d tries to boot from external SPI memory.

SPI boot redefines the following pins:

Normal Mode	SPI Boot Mode	
GPIO0	xCS	
GPIO1	CLK	
DREQ	MOSI	
GPIO2	MISO	

The memory has to be an SPI Bus Serial EEPROM with 16-bit addresses (i.e. at least 1 KiB). The serial speed used by VS1002d is 490 kHz with the nominal 24.576 MHz clock. The first three bytes in the memory have to be 0x50 0x26, 0x48. The exact record format is explained in the Application Notes for VS10XX.

#### 9.5 Play/Decode

This is the normal operation mode of VS1002d. SDI data is decoded. Decoded samples are converted to analog domain by the internal DAC. If there bad problems in the decoding process, the error flags of SCI\_HDAT0 and SCI\_HDAT1 are set to 0 and analog outputs are muted.

When there is no input for decoding, VS1002d goes into idle mode (lower power consumption than during decoding) and actively monitors the serial data input for valid data.

### 9.6 Feeding PCM data

VS1002d can be used as a PCM decoder by sending to it a WAV file header. If the length sent in the WAV file is 0 or 0xFFFFFFF, VS1002d will stay in PCM mode indefinitely. 8-bit linear and 16-bit linear audio is supported in mono or stereo.

#### 9.7 SDI Tests

There are several test modes in VS1002d, which allow the user to perform memory tests, SCI bus tests, and several different sine wave tests.

All tests are started in a similar way: VS1002d is hardware reset, SM\_TESTS is set, and then a test command is sent to the SDI bus. Each test is started by sending a 4-byte special command sequence, followed by 4 zeros. The sequences are described below.

#### **9.7.1** Sine Test

Sine test is initialized with the 8-byte sequence  $0x53\ 0xEF\ 0x6E\ n\ 0\ 0\ 0\ 0$ , where n defines the sine test to use. n is defined as follows:

n bits			
Name	Bits	Description	
$F_s I dx$	7:5	Sample rate index	
S	4:0	Sine skip speed	

$F_s I dx$	$F_s$
0	44100 Hz
1	48000 Hz
2	32000 Hz
3	22050 Hz
4	24000 Hz
5	16000 Hz
6	11025 Hz
7	12000 Hz

The frequency of the sine to be output can now be calculated from  $F = F_s \times \frac{S}{128}$ .

Example: Sine test is activated with value 126, which is 0b01111110. Breaking n to its components,  $F_sIdx=0b011=1$  and thus  $F_s=22050Hz$ . S=0b11110=30, and thus the final sine frequency  $F=22050Hz\times\frac{30}{128}\approx5168Hz$ .

To exit the sine test, send the sequence 0x45 0x78 0x69 0x74 0 0 0 0.

Note: Sine test signals go through the digital volume control, so it is possible to test channels separately.

#### **9.7.2** Pin Test

Pin test is activated with the 8-byte sequence 0x50 0xED 0x6E 0x54 0 0 0 0. This test is meant for chip production testing only.

#### 9.7.3 Memory Test

Memory test mode is initialized with the 8-byte sequence 0x4D 0xEA 0x6D 0x54 0 0 0 0. After this sequence, wait for 200000 clock cycles. The result can be read from the SCI register SCI\_HDAT0, and 'one' bits are interpreted as follows:

Bit(s)	Meaning
15	Test finished
147	Unused
6	Mux test succeeded
5	Good I RAM
4	Good Y RAM
3	Good X RAM
2	Good I ROM
1	Good Y ROM
0	Good X ROM

Memory tests overwrite the current contents of the RAM memories.

#### **9.7.4** SCI Test

Sci test is initialized with the 8-byte sequence  $0x53\ 0x70\ 0xEE\ n\ 0\ 0\ 0\ 0$ , where n-48 is the register number to test. The content of the given register is read and copied to SCI\_HDAT0. If the register to be tested is HDAT0, the result is copied to SCI\_HDAT1.

Example: if n is 48, contents of SCI register 0 (SCI\_MODE) is copied to SCI\_HDAT0.

# 10 VS1002d Registers

# 10.1 Who Needs to Read This Chapter

User software is required when a user wishes to add some own functionality like DSP effects or tone controls to VS1002d.

However, most users of VS1002d don't need to worry about writing their own code, or about this chapter, including those who only download software plug-ins from VLSI Solution's Web site.

#### 10.2 The Processor Core

VS\_DSP is a 16/32-bit DSP processor core that also had extensive all-purpose processor features. VLSI Solution's free VSKIT Software Package contains all the tools and documentation needed to write, simulate and debug Assembly Language or Extended ANSI C programs for the VS\_DSP processor core. VLSI Solution also offers a full Integrated Development Environment VSIDE for full debug capabilities.

# 10.3 VS1002d Memory Map

VS1002d's Memory Map is shown in Figure 14.

#### 10.4 SCI Registers

SCI registers described in Chapter 8.6 can be found here between 0xC000..0xC00F. In addition to these registers, there is one in address 0xC010, called SPI\_CHANGE.

	SPI registers, prefix SPI_					
Reg	Reg Type Reset Abbrev[bits] Description					
0xC010	0xC010 r 0 CHANGE[5:0] Last SCI access address.					

SPI_CHANGE bits				
Name Bits Description				
SPI_CH_WRITE 4		1 if last access was a write cycle.		
SPI_CH_ADDR 3:0		SPI address of last access.		

	Instruction (32-bit)		X (16-bit)	Y (16-bit)	
0000		•			0000
0030	System Vectors		Stack	Stack	0030
0098	User Instruction				0098
0500	RAM		X DATA RAM	Y DATA RAM	0500
0780			IXAIVI		0780
0800				User Space	0800
0C00					0C00
1000				PlusV Space	1000
1380					1380
1400			User Space		1400
1800					1800
4000					4000
6000	Instruction ROM		X DATA ROM	Y DATA ROM	6000
7000					7000
C000					C000
C100			Hardware Register Space		C100

Figure 14: User's Memory Map.

# 10.5 Serial Data Registers

SDI registers, prefix SER_							
Reg	Reg   Type   Reset   Abbrev[bits]   Description						
0xC011	0xC011 r 0 DATA Last received 2 bytes, big-endian.						
0xC012	W	0	DREQ[0]	DREQ pin control.			

39

# 10.6 DAC Registers

DAC registers, prefix DAC_						
Reg Type Reset Abbrev[bits] Description						
0xC013	xC013 rw 0 FCTLL		FCTLL	DAC frequency control, 16 LSbs.		
0xC014	0xC014 rw 0 FCTLH[4:0]		FCTLH[4:0]	Clock doubler + DAC frequency control MSbs.		
0xC015	0xC015 rw 0 LEFT		LEFT	DAC left channel PCM value.		
0xC016	0xC016 rw 0 RIGHT		RIGHT	DAC right channel PCM value.		

Every fourth clock cycle, an internal 26-bit counter is added to by DAC\_FCTLH[3:0]  $\times$  65536 + DAC\_FCTLL. Whenever this counter overflows, values from DAC\_LEFT and DAC\_RIGHT are read and a DAC interrupt is generated.

If DAC\_FCTL[4] is 1, the internal clock doubler is activated.

# 10.7 GPIO Registers

	GPIO registers, prefix GPIO₋						
Reg Type Reset Abbrev[bits] Description							
0xC017	C017 rw 0 DDR[3:0]		DDR[3:0]	Direction.			
0xC018 r 0 IDATA[3:0]			IDATA[3:0]	Values read from the pins.			
0xC019	rw	0	ODATA[3:0]	Values set to the pins.			

GPIO\_DIR is used to set the direction of the GPIO pins. 1 means output. GPIO\_ODATA remembers its values even if a GPIO\_DIR bit is set to input.

GPIO registers don't generate interrupts.

Note: Bits 2 and 3 of GPIO\_DDR and GPIO\_ODATA are switched in prototypes VS1002b and VS1002c. Thus, for example, writing 8 to both registers will set pin GPIO2 to 1 instead of GPIO3.

## 10.8 Interrupt Registers

	Interrupt registers, prefix INT_							
Reg	Type	Reset	Abbrev[bits]	Description				
0xC01A	rw	0	ENABLE[7:0]	Interrupt enable.				
0xC01B	0xC01B w 0 GLOB_DIS[-]			Write to add to interrupt counter.				
0xC01C	0xC01C w 0 GLOB_ENA[-]			Write to subtract from interript counter.				
0xC01D	D rw 0 COUNTER[4:0]			Interrupt counter.				

INT\_ENABLE controls the interrupts. The control bits are as follows:

INT_ENABLE bits					
Name	Bits	Description			
INT_EN_TIM1	7	Enable Timer 1 interrupt.			
INT_EN_TIM0	6	Enable Timer 0 interrupt.			
INT_EN_RX	5	Enable UART RX interrupt.			
INT_EN_TX	4	Enable UART TX interrupt.			
INT_EN_MODU	3	Enable AD modulator interrupt.			
INT_EN_SDI 2		Enable Data interrupt.			
INT_EN_SCI	1	Enable SCI interrupt.			
INT_EN_DAC	0	Enable DAC interrupt.			

Note: It may take upto 6 clock cycles before changing INT\_ENABLE has any effect.

Writing any value to INT\_GLOB\_DIS adds one to the interrupt counter INT\_COUNTER and effectively disables all interrupts. It may take upto 6 clock cycles before writing to this register has any effect.

Writing any value to INT\_GLOB\_ENA subtracts one from the interrupt counter (unless INT\_COUNTER already was 0). If the interrupt counter becomes zero, interrupts selected with INT\_ENABLE are restored. An interrupt routine should always write to this register as the last thing it does, because interrupts automatically add one to the interrupt counter, but subtracting it back to its initial value is the responsibility of the user. It may take upto 6 clock cycles before writing this register has any effect.

By reading INT\_COUNTER the user may check if the interrupt counter is correct or not. If the register is not 0, interrupts are disabled.

# 10.9 A/D Modulator Registers

Interrupt registers, prefix AD <sub>−</sub>						
Reg	Reg Type Reset Abbrev[bits] Description					
0xC01E	0xC01E rw 0 DIV A/D Modulator divider.					
0xC01F						

AD_DIV bits				
Name Bits Description				
ADM_POWERDOWN	15	1 in powerdown.		
ADM_DIVIDER	14:0	Divider.		

ADM\_DIVIDER controls the AD converter's sampling frequency. To gather one sample,  $128 \times n$  clock cycles are used (n is value of AD\_DIV). The lowest usable value is 4, which gives a 48 kHz sample rate when CLKI is 24.576 MHz. When ADM\_POWERDOWN is 1, the A/D converter is turned off.

AD\_DATA contains the latest decoded A/D value.

## **10.10** Watchdog v1.0 2002-08-26

The watchdog consist of a watchdog counter and some logic. After reset, the watchdog is inactive. The counter reload value can be set by writing to WDOG\_CONFIG. The watchdog is activated by writing 0x4ea9 to register WDOG\_RESET. Every time this is done, the watchdog counter is reset. Every 65536'th clock cycle the counter is decremented by one. If the counter underflows, it will activate vs-dsp's internal reset sequence.

Thus, after the first 0x4ea9 write to WDOG\_RESET, subsequent writes to the same register with the same value must be made no less than every 65536×WDOG\_CONFIG clock cycles.

Once started, the watchdog cannot be turned off. Also, a write to WDOG\_CONFIG doesn't change the counter reload value.

After watchdog has been activated, any read/write operation from/to WDOG\_CONFIG or WDOG\_DUMMY will invalidate the next write operation to WDOG\_RESET. This will prevent runaway loops from resetting the counter, even if they do happen to write the correct number. Writing a wrong value to WDOG\_RESET will also invalidate the next write to WDOG\_RESET.

Reads from watchdog registers return undefined values.

#### 10.10.1 Registers

Watchdog, prefix WDOG_						
Reg Type Reset Abbrev Description						
0xC020	w	0	CONFIG	Configuration		
0xC021 w 0 RESET			Clock configuration			
0xC022	W	0	DUMMY[-]	Dummy register		

#### **10.11 UART** v1.0 2002-04-23

RS232 UART implements a serial interface using rs232 standard.

VS1002d

Figure 15: RS232 Serial Interface Protocol

When the line is idling, it stays in logic high state. When a byte is transmitted, the transmission begins with a start bit (logic zero) and continues with data bits (LSB first) and ends up with a stop bit (logic high). 10 bits are sent for each 8-bit byte frame.

#### 10.11.1 Registers

	UART registers, prefix UARTx_						
Reg Type Reset Abbrev Description							
0xC028	r	0	STATUS[3:0]	Status			
0xC029	r/w	0	DATA[7:0]	Data			
0xC02A	r/w	0	DATAH[15:8]	Data High			
0xC02B	r/w	0	DIV	Divider			

#### 10.11.2 Status UARTx\_STATUS

A read from the status register returns the transmitter and receiver states.

UARTx_STATUS Bits			
Name	Bits	Description	
UART_ST_RXORUN	3	Receiver overrun	
UART_ST_RXFULL	2	Receiver data register full	
UART_ST_TXFULL	1	Transmitter data register full	
UART_ST_TXRUNNING	0	Transmitter running	

UART\_ST\_RXORUN is set if a received byte overwrites unread data when it is transferred from the receiver shift register to the data register, otherwise it is cleared.

UART\_ST\_RXFULL is set if there is unread data in the data register.

UART\_ST\_TXFULL is set if a write to the data register is not allowed (data register full).

UART\_ST\_TXRUNNING is set if the transmitter shift register is in operation.

#### 10.11.3 Data UARTx\_DATA

A read from UARTx\_DATA returns the received byte in bits 7:0, bits 15:8 are returned as '0'. If there is no more data to be read, the receiver data register full indicator will be cleared.

A receive interrupt will be generated when a byte is moved from the receiver shift register to the receiver data register.

A write to UARTx\_DATA sets a byte for transmission. The data is taken from bits 7:0, other bits in the written value are ignored. If the transmitter is idle, the byte is immediately moved to the transmitter shift register, a transmit interrupt request is generated, and transmission is started. If the transmitter is busy, the UART\_ST\_TXFULL will be set and the byte remains in the transmitter data register until the previous byte has been sent and transmission can proceed.

#### 10.11.4 Data High UARTx\_DATAH

The same as UARTx\_DATA, except that bits 8..15 are used.

#### 10.11.5 Divider UARTx\_DIV

UARTx_DIV Bits		
Name	Bits	Description
UART_DIV_D1	15:8	Divider 1 (0255)
UART_DIV_D2	7:0	Divider 2 (6255)

The divider is set to 0x0000 in reset. The ROM boot code must initialize it correctly depending on the master clock frequency to get the correct bit speed. The second divider  $(D_2)$  must be from 6 to 255.

The communication speed  $f = \frac{f_m}{(D_1+1)\times(D_2)}$ , where  $f_m$  is the master clock frequency, and f is the TX/RX speed in bps.

Divider values for common communication speeds at 26 MHz master clock:

Example UART Speeds, $f_m = 26MHz$			
Comm. Speed [bps]	UART_DIV_D1	UART_DIV_D2	
4800	85	63	
9600	42	63	
14400	42	42	
19200	51	26	
28800	42	21	
38400	25	26	
57600	1	226	
115200	0	226	

#### 10.11.6 Interrupts and Operation

Transmitter operates as follows: After an 8-bit word is written to the transmit data register it will be transmitted instantly if the transmitter is not busy transmitting the previous byte. When the transmission begins a TX\_INTR interrupt will be sent. Status bit [1] informs the transmitter data register empty (or full state) and bit [0] informs the transmitter (shift register) empty state. A new word must not be written to transmitter data register if it is not empty (bit [1] = 0). The transmitter data register will be empty as soon as it is shifted to transmitter and the transmission is begun. It is safe to write a new word to transmitter data register every time a transmit interrupt is generated.

VS1002d

Receiver operates as follows: It samples the RX signal line and if it detects a high to low transition, a start bit is found. After this it samples each 8 bit at the middle of the bit time (using a constant timer), and fills the receiver (shift register) LSB first. Finally if a stop bit (logic high) is detected the data in the receiver is moved to the reveive data register and the RX\_INTR interrupt is sent and a status bit[2] (receive data register full) is set, and status bit[2] old state is copied to bit[3] (receive data overrun). After that the receiver returns to idle state to wait for a new start bit. Status bit[2] is zeroed when the receiver data register is read.

RS232 communication speed is set using two clock dividers. The base clock is the processor master clock. Bits 15-8 in these registers are for first divider and bits 7-0 for second divider. RX sample frequency is the clock frequency that is input for the second divider.

#### **10.12** Timers v1.0 2002-04-23

There are two 32-bit timers that can be initialized and enabled independently of each other. If enabled, a timer initializes to its start value, written by a processor, and starts decrementing every clock cycle. When the value goes past zero, an interrupt is sent, and the timer initializes to the value in its start value register, and continues downcounting. A timer stays in that loop as long as it is enabled.

A timer has a 32-bit timer register for down counting and a 32-bit TIMER1\_LH register for holding the timer start value written by the processor. Timers have also a 2-bit TIMER\_ENA register. Each timer is enabled (1) or disabled (0) by a corresponding bit of the enable register.

### 10.12.1 Registers

Timer registers, prefix TIMER_				
Reg	Type	Reset	Abbrev	Description
0xC030	r/w	0	CONFIG[7:0]	Timer configuration
0xC031	r/w	0	ENABLE[1:0]	Timer enable
0xC034	r/w	0	T0L	Timer0 startvalue - LSBs
0xC035	r/w	0	ТОН	Timer0 startvalue - MSBs
0xC036	r/w	0	T0CNTL	Timer0 counter - LSBs
0xC037	r/w	0	T0CNTH	Timer0 counter - MSBs
0xC038	r/w	0	T1L	Timer1 startvalue - LSBs
0xC039	r/w	0	T1H	Timer1 startvalue - MSBs
0xC03A	r/w	0	T1CNTL	Timer1 counter - LSBs
0xC03B	r/w	0	T1CNTH	Timer1 counter - MSBs

#### 10.12.2 Configuration TIMER\_CONFIG

TIMER_CONFIG Bits		
Name	Bits	Description
TIMER_CF_CLKDIV	7:0	Master clock divider

TIMER\_CF\_CLKDIV is the master clock divider for all timer clocks. The generated internal clock frequency  $f_i = \frac{f_m}{c+1}$ , where  $f_m$  is the master clock frequency and c is TIMER\_CF\_CLKDIV. Example: With a 12 MHz master clock, TIMER\_CF\_DIV=3 divides the master clock by 4, and the output/sampling clock would thus be  $f_i = \frac{12MHz}{3+1} = 3MHz$ .

#### 10.12.3 Configuration TIMER\_ENABLE

TIMER ENABLE Bits		
Name	Bits	Description
TIMER_EN_T1	1	Enable timer 1
TIMER_EN_T0	0	Enable timer 0

#### 10.12.4 Timer X Startvalue TIMER\_Tx[L/H]

The 32-bit start value TIMER\_Tx[L/H] sets the initial counter value when the timer is reset. The timer interrupt frequency  $f_t = \frac{f_i}{c+1}$  where  $f_i$  is the master clock obtained with the clock divider (see Chapter 10.12.2 and c is TIMER\_Tx[L/H].

Example: With a 12 MHz master clock and with TIMER\_CF\_CLKDIV=3, the master clock  $f_i = 3MHz$ . If TIMER\_TH=0, TIMER\_TL=99, then the timer interrupt frequency  $f_t = \frac{3MHz}{99+1} = 30kHz$ .

#### 10.12.5 Timer X Counter TIMER\_TxCNT[L/H]

TIMER\_TxCNT[L/H] contains the current counter values. By reading this register pair, the user may get knowledge of how long it will take before the next timer interrupt. Also, by writing to this register, a one-shot different length timer interrupt delay may be realized.

#### 10.12.6 Interrupts

Each timer has its own interrupt, which is asserted when the timer counter underflows.

## 10.13 System Vector Tags

The System Vector Tags are tags that may be replaced by the user to take control over several decoder functions.

#### 10.13.1 AudioInt, 0x20

Normally contains the following VS\_DSP assembly code:

```
jmpi DAC_INT_ADDRESS,(i6)+1
```

The user may, at will, replace the first instruction with a jmpi command to gain control over the audio interrupt.

#### 10.13.2 SciInt, 0x21

Normally contains the following VS\_DSP assembly code:

```
jmpi SCI INT ADDRESS,(i6)+1
```

The user may, at will, replace the instruction with a jmpi command to gain control over the SCI interrupt.

#### 10.13.3 DataInt, 0x22

Normally contains the following VS\_DSP assembly code:

```
jmpi SDI_INT_ADDRESS,(i6)+1
```

The user may, at will, replace the instruction with a jmpi command to gain control over the SDI interrupt.

#### 10.13.4 ModuInt, 0x23

Normally contains the following VS\_DSP assembly code:

```
jmpi MODU_INT_ADDRESS,(i6)+1
```

The user may, at will, replace the instruction with a jmpi command to gain control over the AD Modulator interrupt.

#### 10.13.5 TxInt, 0x24

Normally contains the following VS\_DSP assembly code:

```
jmpi EMPTY_INT_ADDRESS,(i6)+1
```

The user may, at will, replace the instruction with a jmpi command to gain control over the UART TX interrupt.

#### 10.13.6 RxInt, 0x25

Normally contains the following VS\_DSP assembly code:

```
jmpi RX_INT_ADDRESS,(i6)+1
```

The user may, at will, replace the first instruction with a jmpi command to gain control over the UART RX interrupt.

#### 10.13.7 Timer0Int, 0x26

Normally contains the following VS\_DSP assembly code:

```
jmpi EMPTY_INT_ADDRESS,(i6)+1
```

The user may, at will, replace the first instruction with a jmpi command to gain control over the Timer 0 interrupt.

#### 10.13.8 Timer1Int, 0x27

Normally contains the following VS\_DSP assembly code:

```
jmpi EMPTY_INT_ADDRESS,(i6)+1
```

The user may, at will, replace the first instruction with a jmpi command to gain control over the Timer 1 interrupt.

#### 10.13.9 UserCodec, 0x0

Normally contains the following VS\_DSP assembly code:

jr nop

If the user wants to take control away from the standard decoder, the first instruction should be replaced with an appropriate j command to user's own code.

Unless the user is feeding MP3 data at the same time, the system activates the user program in less than 1 ms. After this, the user should steal interrupt vectors from the system, and insert user programs.

#### **10.14** System Vector Functions

The System Vector Functions are pointers to some functions that the user may call to help implementing his own applications.

#### 10.14.1 WriteIRam(), 0x2

VS\_DSP C prototype:

void WriteIRam(register \_i0 u\_int16 \*addr, register \_a1 u\_int16 msW, register \_a0 u\_int16 lsW);

This is the only supported way to write to the User Instruction RAM. This is because Instruction RAM cannot be written when program control is in RAM. Thus, the actual implementation of this function is in ROM, and here is simply a tag to that routine.

#### 10.14.2 ReadIRam(), 0x4

VS\_DSP C prototype:

u\_int32 ReadIRam(register \_\_i0 u\_int16 \*addr);

This is the only supported way to read from the User Instruction RAM. This is because Instruction RAM cannot be read when program control is in RAM. Thus, the actual implementation of this function is in ROM, and here is simply a tag to that routine.

A1 contains the MSBs and a0 the LSBs of the result.

#### 10.14.3 DataBytes(), 0x6

VS\_DSP C prototype:

u\_int16 DataBytes(void);

If the user has taken over the normal operation of the system by switching the pointer in UserCodec to point to his own code, he may read data from the Data Interface through this and the following two functions.

VS1002d

This function returns the number of data bytes that can be read.

#### 10.14.4 GetDataByte(), 0x8

VS\_DSP C prototype:

u\_int16 GetDataByte(void);

Reads and returns one data byte from the Data Interface. This function will wait until there is enough data in the input buffer.

### 10.14.5 GetDataWords(), 0xa

VS\_DSP C prototype:

void GetDataWords(register \_i0 \_y u\_int16 \*d, register \_a0 u\_int16 n);

Read n data byte pairs and copy them in big-endian format (first byte to MSBs) to d. This function will wait until there is enough data in the input buffer.

# 10.14.6 Reboot(), 0xc

VS\_DSP C prototype:

void Reboot(void);

Causes a software reboot.

# 11 VS1002 Version Changes

This chapter describes changes between different generations of VS1002.

# 11.1 Changes Between VS1002c and VS1002d, 2004-05-13

• ADPCM recording now works without software patches.

# 12 Document Version Changes

This chapter describes the most important changes to this document.

#### 12.1 Version 1.0 for VS1002d, 2005-04-27

- RX should be connected to VDD if UART is not used.
- Limits updated
- Qualified production version

### 12.2 Version 0.71 for VS1002d, 2004-07-20

• Added instructions to add  $100 \text{ k}\Omega$  pull-down resistor to unused GPIOs to Chapter 5.2.

## 12.3 Version 0.70 for VS1002d, 2004-05-13

- Updated document for VS1002d.
- Removed SM\_JUMP.

# 12.4 Version 0.62 for VS1002c, 2004-03-24

- Redrew Figure 3 to include new microphone connection and serial port.
- Rewrote and clarified Chapter 8.2, Supported Audio Codecs.

#### 12.5 Version 0.61 for VS1002c, 2004-03-11

• Added samplerate and bitrate tables to Chapter 8.6.9.

#### 12.6 Version 0.6 for VS1002c, 2004-02-13

- A/D Modulator powerdown bit explained in (Chapter 10.9).
- Added BGA-49 to Packages and Pin Descriptions (Chapter 5).
- Added new Chapter 8.2, Supported Audio Codecs.
