

# PCM512x 2- $V_{RMS}$ DirectPath™, 112/106-dB Audio Stereo DAC With 32-bit, 384-kHz PCM Interface

## 1 Features

- Register-Selectable Audio-Processing Functions up to 48-kHz  $f_s$ 
  - Dynamic Range Control (DRC)
  - Equalization (EQ)
  - Filtering
- DAC Functionality to 384-kHz  $f_s$
- Market-Leading Low Out-of-Band Noise
- Selectable Digital-Filter Latency and Performance
- No DC-Blocking Capacitors Required
- Integrated Negative Charge Pump
- Intelligent Muting System; Soft Up or Down Ramp and Analog Mute for 120-dB Mute SNR
- Integrated High-Performance Audio PLL With BCK Reference to Generate SCK Internally
- Accepts 16-, 20-, 24-, and 32-Bit Audio Data
- PCM Data Formats: I<sup>2</sup>S, Left-Justified, Right-Justified, TDM / DSP
- SPI or I<sup>2</sup>C Control
- Software or Hardware Configuration
- Automatic Power-Save Mode When LRCK and BCK are Deactivated
- 1.8-V or 3.3-V Failsafe LVCMOS Digital Inputs
- Single Supply Operation:
  - 3.3-V Analog, 1.8-V or 3.3-V Digital
- Integrated Power-On Reset
- Small28-Pin Package

## 2 Applications

- A/V Receivers
- DVD, BD Players
- HDTV Receivers
- Applications Requiring 2- $V_{RMS}$  Audio Output

## 3 Description

The PCM512x devices are a family of monolithic CMOS-integrated circuits that include a stereo digital-to-analog converter and additional support circuitry in a small TSSOP package. The PCM512x uses the latest generation of TI's advanced segment-DAC architecture to achieve excellent dynamic performance and improved tolerance to clock jitter.

Members of the PCM512x family integrate preset audio processing functions with programmable coefficients, allowing developers to change the characteristics of the interpolation filter, speaker EQ, dynamic range controls, and average volume control in their products.

The PCM512x provides 2.1- $V_{RMS}$  ground-centered outputs, allowing designers to eliminate DC-blocking capacitors on the output, as well as external muting circuits traditionally associated with single supply line drivers.

The integrated line driver surpasses all other charge-pump-based line drivers by supporting loads down to 1 k $\Omega$ . By supporting loads down to 1 k $\Omega$ , the PCM512x can essentially drive up to 10 products in parallel (LCD TV, DVDR, AV receivers, and so forth).

The integrated PLL on the device removes the requirement for a system clock (commonly known as master clock), allowing a 3-wire I<sup>2</sup>S connection, along with reducing system EMI.

### Device Information<sup>(1)</sup>

| PART NUMBER | PACKAGE    | BODY SIZE (NOM) |
|-------------|------------|-----------------|
| PCM5121     | TSSOP (28) | 9.7 mm × 4.4 mm |
| PCM5122     |            |                 |

(1) For all available packages, see the orderable addendum at the end of the data sheet.

### Simplified System Diagram

## 4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

| Changes from Revision A (September 2012) to Revision B                                                                                                                                                                                                                                                                                                                                                      | Page |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------|
| • Changed <i>Accepts 16-, 24-, And 32-Bit Audio Data</i> to <i>Accepts 16-, 20-, 24-, And 32-Bit Audio Data</i> .....                                                                                                                                                                                                                                                                                       | 1    |
| • Deleted <i>Internal Pop-Free Control For Sample-Rate Changes Or Clock Halts, .. With Popless Operation</i> .....                                                                                                                                                                                                                                                                                          | 1    |
| • Added <i>Pin Configuration and Functions</i> section, <i>ESD Ratings</i> table, <i>Feature Description</i> section, <i>Device Functional Modes</i> section, <i>Application and Implementation</i> section, <i>Power Supply Recommendations</i> section, <i>Layout</i> section, <i>Device and Documentation Support</i> section, and <i>Mechanical, Packaging, and Orderable Information</i> section ..... | 1    |
| • Clarified <i>Pin Functions</i> table.....                                                                                                                                                                                                                                                                                                                                                                 | 5    |
| • Changed <i>Operating temperature</i> to <i>Operating junction temperature</i> in <i>Absolute Maximum Ratings</i> .....                                                                                                                                                                                                                                                                                    | 7    |
| • Deleted redundant PLL specification in <i>Recommended Operating Conditions</i> .....                                                                                                                                                                                                                                                                                                                      | 7    |
| • Deleted <i>Intelligent clock error...</i> and <i>...for pop-free performance</i> in the <i>Overview</i> section. ....                                                                                                                                                                                                                                                                                     | 14   |
| • Added note on instruction cycle requirements. ....                                                                                                                                                                                                                                                                                                                                                        | 20   |
| • Added note on instruction cycles in <i>Fixed Audio Processing Flow (Program 5)</i> .....                                                                                                                                                                                                                                                                                                                  | 34   |
| • Changed <i>Ouput</i> to <i>Output</i> .....                                                                                                                                                                                                                                                                                                                                                               | 42   |
| • Deleted <i>VREF mode provides 2.1V<sub>rms</sub> full-scale output at both AVDD levels</i> .....                                                                                                                                                                                                                                                                                                          | 42   |
| • Clarified clock generation explanation in <i>Reset and System Clock Functions</i> .....                                                                                                                                                                                                                                                                                                                   | 45   |
| • Clarified external SCK discussion in <i>Clock Slave Mode with BCK PLL to Generate Internal Clocks (3-Wire PCM)</i> .....                                                                                                                                                                                                                                                                                  | 47   |
| • Deleted <i>The PCM512x disables the internal PLL when an external SCK is supplied.</i> .....                                                                                                                                                                                                                                                                                                              | 47   |

## 5 Device Comparison

**Table 1. Differences Between PCM512x Devices**

| PART NUMBER | DYNAMIC RANGE | SNR    | THD    |
|-------------|---------------|--------|--------|
| PCM5122A    | 112 dB        | 112 dB | –93 dB |
| PCM5121A    | 106 dB        | 106 dB | –92 dB |

| Digital input voltage                 | DVDD at 1.8 V          | −0.3 | 2.25 | V    |
|                                       | DVDD at 3.3 V          | −0.3 | 3.9  |      |
| Analog input voltage                  |                        | −0.3 | 3.9  | V    |
| Operating junction temperature, $T_J$ |                        | −40  | 130  | °C   |
| Storage temperature, $T_{stg}$        |                        | −65  | 150  | °C   |

### 7.2 ESD Ratings

|                                     |                                                                                | VALUE | UNIT |
|-------------------------------------|--------------------------------------------------------------------------------|-------|------|
| $V_{(ESD)}$ Electrostatic discharge | Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>              | ±2000 | V    |
|                                     | Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup> | ±750  |      |

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 7.3 Recommended Operating Conditions

|                                             |                                    |            | MIN  | NOM | MAX  | UNIT |
|---------------------------------------------|------------------------------------|------------|------|-----|------|------|
| $A_{VDD}$ Analog power supply voltage       | Referenced to AGND <sup>(1)</sup>  | VCOM mode  | 3    | 3.3 | 3.46 | V    |
|                                             |                                    | VREF mode  | 3.2  | 3.3 | 3.46 |      |
| $D_{VDD}$ Digital power supply voltage      | Referenced to DGND <sup>(1)</sup>  | 1.8 V DVDD | 1.65 | 1.8 | 1.95 | V    |
|                                             |                                    | 3.3 V DVDD | 3.1  | 3.3 | 3.46 |      |
| CPVDD Charge pump supply voltage            | Referenced to CPGND <sup>(1)</sup> |            | 3.1  | 3.3 | 3.46 | V    |
| MCLK Master clock frequency                 |                                    |            |      |     | 50   | MHz  |
| LOL, LOR Stereo line output load resistance |                                    |            | 1    | 10  |      | kΩ   |
| $C_{LOUT}$ Digital output load capacitance  |                                    |            |      | 10  |      | pF   |
| $T_J$ Operating junction temperature        |                                    |            | −40  |     | 130  | °C   |

(1) All grounds on board are tied together; they must not differ in voltage by more than 0.2-V maximum, for any combination of ground signals.

### 7.4 Thermal Information

| THERMAL METRIC <sup>(1)</sup> |                                              | PCM512x     | UNIT |
|-------------------------------|----------------------------------------------|-------------|------|
|                               |                                              | RHB (TSSOP) |      |

## 8 Detailed Description

### 8.1 Overview

The integrated PLL on the device provided adds the flexibility to remove the system clock (commonly known as master clock), allowing a 3-wire I<sup>2</sup>S connection and reducing system EMI. In addition, the PLL is completely programmable, allowing the device to become the I<sup>2</sup>S clock master and drive a DSP serial port as a slave. The PLL also accepts a non-standard clock (up to 50 MHz) as a source to generate the audio related clock (for example, 24.576 MHz).

Powersense undervoltage protection utilizes a two-level mute system. Upon clock error or system power failure, the device digitally attenuates the data (or last known good data) and then mutes the analog circuit.

Compared with existing DAC technology, the PCM512x devices offer up to 20-dB lower out-of-band noise, reducing EMI and aliasing in downstream amplifiers/ADCs (from traditional 100-kHz OBN measurements to 3 MHz).

The PCM512x devices accept industry-standard audio data formats with 16- to 32-bit data. Sample rates up to 384 kHz are supported.

### 8.2 Functional Block Diagram

### 8.3 Feature Description

#### 8.3.1 Terminology

Control registers in this data sheet are given by **REGISTER BIT/BYTE NAME (Page.x HEX ADDRESS)**. SE refers to *single-ended* analog inputs. SCK (System Clock) and MCLK (Master Clock) are used interchangeably. Sampling frequency is symbolized by  $f_s$ . Full scale is symbolized by FS. Sample time as a unit is symbolized by  $t_s$ .

## Feature Description (continued)

### 8.3.2 Audio Data Interface

#### 8.3.2.1 Audio Serial Interface

The audio interface port is a 3-wire serial port with the signals LRCK, BCK, and DIN. BCK is the serial audio bit clock, used to clock the serial data present on DIN into the serial shift register of the audio interface. Serial data is clocked into the PCM512x on the rising edge of BCK. LRCK is the serial audio left/right word clock. LRCK polarity for left/right is given by the format selected.

|                                               |                     |                | 192 kHz                      | 128, 192, 256             | 128                       |
| Hardware Control                              | I <sup>2</sup> S/LJ | 32, 24, 20, 16 | Up to 192 kHz                | 128 – 3072                | 64, 48, 32                |
|                                               |                     |                | 384 kHz                      | 64, 128                   | 64, 48, 32                |

The PCM512x requires the synchronization of LRCK and system clock, but does not need a specific phase relation between LRCK and system clock.

If the relationship between LRCK and system clock changes more than  $\pm 5$  SCK, internal operation (using an onchip oscillator) is initialized within one sample period and analog outputs are forced to the bipolar zero level until resynchronization between LRCK and system clock is completed.

If the relationship between LRCK and BCK are invalid more than 4 LRCK periods, internal operation (using an onchip oscillator) is initialized within one sample period and analog outputs are forced to the bipolar zero level until resynchronization between LRCK and BCK is completed.

#### 8.3.2.2 PCM Audio Data Formats

The PCM512x supports industry-standard audio data formats, including standard I<sup>2</sup>S and left-justified. Data formats are selected via Register (Pg0Reg40). All formats require binary twos-complement, MSB-first audio data; up to 32-bit audio data is accepted.

The PCM512x also supports right-justified and TDM/DSP in software control mode. I<sup>2</sup>S, LJ, RJ, and TDM/DSP are selected using Register (Pg0Reg40). All formats require binary twos-complement, MSB-first audio data. Up to 32 bits are accepted. Default setting is I<sup>2</sup>S and 24-bit word length.

**Figure 13. Left-Justified Audio Data Format**

I²S Data Format; L-channel = LOW, R-channel = HIGH

**Figure 14. I²S Audio Data Format**

The following data formats are only available in software mode.

Right Justified Data Format; L-channel = HIGH, R-channel = LOW

**Figure 15. Right-Justified Audio Data Format**

TDM/DSP Data Format; L-channel = FIRST, R-channel = LAST with OFFSET = 0

**Figure 16. TDM/DSP 1 Audio Data Format**

**NOTE**

In TDM Modes, Duty Cycle of LRCK should be 1x BCK at minimum. Rising edge is considered frame start.

**Figure 17. TDM/DSP 2 Audio Data Format**

**Figure 18. TDM/DSP 3 Audio Data Format**

### 8.3.2.3 Zero Data Detect

The PCM512x has a zero-detect function. When the device detects the continuous zero data for both left and right channels, or separate channels, Analog mutes are set to both OUTL and OUTR, or separate OUTL and OUTR. These are controlled by Page 0, Register 65, D(2:1) as shown in [Table 5](#).

Continuous Zero data cycles are counted by LRCK, and the threshold of decision for analog mute can be set by Page 0, Register 59, D(6:4) for L-ch, and D(2:0) for Rch as shown in [Table 6](#). Default values are 0 for both channels.

In Hardware mode, the device uses default values. By default, Both L-ch and R-ch have to be zero data for zero data detection to begin the muting process etc.

**Table 5. Zero Data Detection Mode**

| ATMUTECTL | VALUE       | FUNCTION                                                         |
|-----------|-------------|------------------------------------------------------------------|
| Bit : 2   | 0           | Independently L-ch or R-ch are zero data for zero data detection |
|           | 1 (Default) | Both L-ch and R-ch have to be zero data for zero data detection  |
| Bit : 1   | 0           | Zero detection and analog mute are disabled for R-ch             |
|           | 1 (Default) | Zero detection analog mute are enabled for R-ch                  |
| Bit : 0   | 0           | Zero detection analog mute are disabled for L-ch                 |
|           | 1 (Default) | Zero detection analog mute are enabled for L-ch                  |

**Table 6. Zero Data Detection Time**

| ATMUTETIML /<br>ATMUTETIMR | NUMBER OF LRCKs | TIME AT 48 kHz |
|----------------------------|-----------------|----------------|
| 0 0 0                      | 1024            | 21 ms          |
| 0 0 1                      | 5120            | 106 ms         |
| 0 1 0                      | 10240           | 213 ms         |
| 0 1 1                      | 25600           | 533 ms         |
| 1 0 0                      | 51200           | 1.066 sec      |
| 1 0 1                      | 102400          | 2.133 sec      |
| 1 1 0                      | 256000          | 5.333 sec      |
| 1 1 1                      | 512000          | 10.66 sec      |

### 8.3.3 XSMT Pin (Soft Mute / Soft Un-Mute)

An external digital host controls the PCM512x soft mute function by driving the XSMT pin with a specific minimum rise time ( $t_r$ ) and fall time ( $t_f$ ) for soft mute and soft un-mute. The PCM512x requires  $t_r$  and  $t_f$  times of less than 20 ns. In the majority of applications, this is no problem; however, traces with high capacitance may have issues.

When the XSMT pin is shifted from high to low (3.3 V to 0 V), a soft digital attenuation ramp begins. –1-dB attenuation is then applied every sample time from 0 dBFS to  $-\infty$ . The soft attenuation ramp takes 104 samples.

When the XSMT pin is shifted from low to high (0 V to 3.3 V), a soft digital *un-mute* is started. 1-dB gain steps are applied every sample time from  $-\infty$  to 0 dBFS. The un-mute takes 104 samples.

In systems where XSMT is not required, it can be directly connected to AVDD.

### 8.3.4 Audio Processing

#### 8.3.4.1 PCM512x Audio Processing

##### 8.3.4.1.1 Overview

The PCM512x supports a fixed audio processing flow with programmable coefficients. (Program 5 - [Fixed Audio Processing Flow \(Program 5\)](#) of this data sheet). Details can be found below.

---

#### NOTE

At higher sampling frequencies, fewer instruction cycles are available. (For example, 512 instructions can be done in a 96-kHz frame.)

---

The audio processing chain can run up to 1024 instructions on every audio sample at a 48-kHz sample rate.

##### 8.3.4.1.2 Software

Software development for the PCM512x is supported through TI's comprehensive PurePath Studio Development Environment; a powerful, easy-to-use tool designed specifically to simplify software development on the PCM512x audio platform. The Graphical Development Environment consists of a library of common audio functions that can be dragged-and-dropped into an audio signal flow and graphically connected together. The DSP code can then be assembled from the graphical signal flow with the click of a mouse.

Please visit the PCM512x product folder on [www.ti.com](http://www.ti.com) to learn more about PurePath Studio and the latest status on available, ready-to-use DSP algorithms.

### 8.3.4.2 Interpolation Filter

The PCM512x provides 4 types of interpolation filters, selectable by writing to Page 0, Register 43, D(4:0).

**Table 7. ROM Preset Programs**

| PROGRAM NUMBER | D(4:0) | DESCRIPTION                                                   | MINIMUM CYCLES |
|----------------|--------|---------------------------------------------------------------|----------------|
| 0              | 0 0000 | Reserved                                                      |                |
| 1              | 0 0001 | Normal x8/x4/x2/x1 Interpolation Filter <sup>(1)</sup>        | 256            |
| 2              | 0 0010 | Low Latency x8/x4/x2/x1 Interpolation Filter <sup>(1)</sup>   | 256            |
| 3              | 0 0011 | High Attenuation x8/x4/x2 Interpolation Filter <sup>(1)</sup> | 512            |
| 4              | 0 0100 | Reserved                                                      |                |
| 5              | 0 0101 | Preset Process Flow                                           |                |
| 6              | 0 0110 | Reserved                                                      |                |
| 7              | 0 0111 | Asymmetric FIR Interpolation Filter <sup>(1)</sup>            | 512            |
| :              | :      | Reserved                                                      |                |
| 31             | 1 1111 | Reserved                                                      |                |

(1) At  $f_s=44.1$  kHz, de-emphasis filter is supported.

The PCM512x supports four sampling modes (single rate, dual rate, quad rate, and octal rate) which produce different oversampling rates (OSR) in the interpolation digital filter operation. These are shown in [Table 8](#).

**Table 8. Sampling Modes and Oversampling Rates**

| SAMPLING MODE | SAMPLING FREQUENCY ( $f_s$ ) kHz | OVERSAMPLING RATE (OSR) |
|---------------|----------------------------------|-------------------------|
| Single Rate   | 8                                | 8 or 16                 |
|               | 16                               |                         |
|               | 32                               |                         |
|               | 44.1                             |                         |
|               | 48                               |                         |
| Dual Rate     | 88.2                             | 4                       |
|               | 96                               |                         |
| Quad Rate     | 176.4                            | 2                       |
|               | 192                              |                         |
| Octal Rate    | 384                              | 1 (Bypass)              |

### 8.3.4.3 Fixed Audio Processing Flow (Program 5)

The PCM512x implements signal processing capabilities and interpolation filtering via processing blocks. These fixed processing blocks give users the choice of how much and what type of signal processing they may use and which interpolation filter is applied.

The signal processing blocks available are:

- Biquad filters
- Multiband DRC
- Mono mixer
- Stereo mixer
- Average volume control

Users can find more details in [Purepath Studio](#).

#### NOTE

This process flow requires 1024 instruction cycles. Therefore, it will only function at sampling frequencies up to 48 kHz.

#### 8.3.4.3.1 Filter Programming Changes

The following sequence must be followed to change the ROM program:

1. Enter Stand-by mode. (Set Page 0, Register 2, D(4))
2. Change program number. (Set Page 0, Register 43, D(4:0))
3. Exit Stand-by mode. (Reset Page 0, Register 2, D(4))

#### 8.3.4.3.2 Processing Blocks – Detailed Descriptions

Figure 55 shows the fixed processing flow.

**Figure 55. Preset Process Flow**

Figure 56 shows a screen capture of PurePath Studio.

Figure 56. PurePath Studio Screen Capture

#### 8.3.4.3.3 Biquad Section

The transfer function of each of the biquad filters is given by Equation 1.

$$H(z) = \frac{N_0 + 2N_1z^{-1} + N_2z^{-2}}{2^{23} - 2D_1z^{-1} - D_2z^{-2}} \quad (1)$$

Figure 57. Biquad Block

#### 8.3.4.3.4 Dynamic Range Compression

Dynamic range compression (DRC) improves the overall listening experience. Typical music signals are characterized by crest factors (the ratio of peak signal power to average signal power) of 12 dB or more. To avoid audible distortion due to clipping of peak signals, the gain of the DAC channel must be adjusted so as not to cause hard clipping. As a result, the low applied gain during nominal periods causes the perception that the signal is not loud enough. To overcome this problem, the DRC in the PCM512x continuously monitors the output of the DAC Digital Volume control to detect its power level with respect to 0-dB full-scale. When the power level is low, the DRC increases the input signal gain to make it sound louder, and reduces the gain during peaks to avoid hard clipping. The DRC enables louder audio during nominal periods with a clearer, more pleasant listening experience.

The 3-band DRC function applies DRC to 3 different mono/stereo signals with 3 different time constants. The same DRC curve is applied on all the signals, enabling a multi-band DRC solution. The underlying DRC algorithm is the same as that available with the DRC component in PurePath Studio. In this instance, the DRC gain acts on each signal in time-multiplexed order, for example, 1-2-3, 1-2-3, 1-2-3.

**Table 22. DRC Coefficients**

#### 8.3.4.3.5 Stereo Mixer

Three stereo inputs are mixed into one stereo output with input signal gain given by [Equation 2](#).

$$\text{Out\_L}(n) = \sum (\text{Input\_L}(i,n) \bullet \text{Gain}(i))$$

where

- $i=1:2,3$

(2)

[Figure 58](#) and [Table 23](#) show the stereo mixer operation.

**Figure 58. Stereo Mixer Block**

**Table 23. Stereo Mixer Coefficients**

## 8.3.5 DAC Outputs

### 8.3.5.1 Analog Outputs

The PCM512x devices include a two-channel DAC, with single-ended outputs. The full-scale output voltage is  $2.1V_{rms}$  with ground center output. A dc-coupled load is supported in addition to an ac-coupled load, if the load resistance conforms to the specification. The PCM512x DAC outputs on the OUTL and OUTR terminals have market-leading low out-of-band noise, which offer up to 20dB lower out-of-band noise compared with existing DAC technology.

Most applications require an external low-pass RC filter ( $470\Omega + 2.2nF$ ) to provide sufficient out-of-band noise rejection. This RC filter provides the added advantage of improved protection against ESD damage.

### 8.3.5.2 Recommended Output Filter for the PCM512x

The diagram in [Figure 61](#) shows the recommended output filter for the PCM512x. The new PCM512x next-generation current segment architecture offers excellent out-of-band noise, making a traditional 20-kHz low pass filter a thing of the past.

The RC settings below offer a  $-3\text{-dB}$  filter point at 153 kHz (approximately), giving the DAC the ability to reproduce virtually all frequencies through to its maximum sampling rate of 384 kHz. A NP0/C0G type capacitor is strongly recommended for the shunt capacitor for lowest distortion.

**Figure 61. Recommended Output Lowpass Filter for 10-kΩ Operation**

### 8.3.5.3 Choosing Between VREF and VCOM Modes

VREF mode is the default configuration. This mode allows full  $2.1V_{rms}$  signal output. As shown in [Recommended Operating Conditions](#), the minimum AVDD to avoid clipping is 3.2 V.

VCOM mode allows setting a custom common-mode voltage when required by the application. This somewhat limits the output signal swing before clipping.

#### 8.3.5.3.1 Voltage Reference and Output Levels

The PCM512x devices have an internal, fixed band-gap reference voltage, with default operation in VREF mode. No external decoupling capacitor is required for this mode.

The PCM512x devices can be operated with a common-mode voltage output (VCOM mode) at the VCOM pin by setting Page 1, Register 1, D(0) to 1. In this mode, an external decoupling capacitor is required.

When using this DAC in VREF mode, the output-signal voltage is independent of the power-supply voltage: The D/A conversion gain in VREF mode yields a  $2.1V_{rms}$  output voltage with a digital full-scale input. However, in VREF mode, an output waveform may clip due to the limitations that may be present in the analog power supply voltage. On the other hand, the full-scale output voltage in VCOM mode is proportional to the analog power supply AVDD (for example,  $(2.1 \times AVDD / 3.3) V_{rms}$ ).

### 8.3.5.3.2 Mode Switching Sequence, from VREF Mode to VCOM Mode

Following register setting sequence is recommended for changing VREF mode to VCOM mode.

1. Page 0 / Register 2 RQST = 1: Standby mode
2. Page 1 / Register 8 RCMF = 1: Fast ramp up → on
3. Page 1 / Register 9 VCPD = 0: VCOM is power on
4. Wait 3 ms with external capacitor = 1  $\mu$ F
5. Page 1 / Register 8 RCMF = 0: Fast ramp up → off
6. Page 1 / Register 1 OSEL = 1: VCOM mode
7. Page 0 / Register 2 RQST = 0: Normal mode

### 8.3.5.4 Digital Volume Control

A basic digital volume control with range from 24 dB to –103 dB and mute is available on each channels by Page 0, Register 61, D(7:0) for L-ch and Register 62, D(7:0) for R-ch. These volume controls all have 0.5-dB step programmability over most gain and attenuation ranges. [Table 29](#) lists the detailed gain versus programmed setting for this basic volume control. Volume can be changed for both L-ch and R-ch at the same time or independently by Page 0, Register 60, D(1:0). When D(1:0) set 00 (default), independent control is selected. When D(1:0) set 01, R-ch accords with L-ch volume. When D(1:0) set 10, L-ch accords with R-ch volume. To set D(1:0) to 11 is prohibited.

#### NOTE

This volume control is done externally to the miniDSP and only influences the analog DAC output. Any changes to the SDOUT data should be done in the miniDSP process flow.

**Table 29. Digital Volume Control Settings**

| GAIN SETTING | BINARY DATA | GAIN (dB)  | COMMENTS                 |
|--------------|-------------|------------|--------------------------|
| 0            | 0000-0000   | 24.0       | Positive maximum         |
| 1            | 0000-0001   | 23.5       |                          |
| :            | :           | —          |                          |

#### 8.3.5.4.1 Emergency Ramp-Down

Digital volume emergency ramp-down by is provided for situations such as I<sup>2</sup>S clock error and power supply failure. Ramp-down speed is controlled by Page 0, Register 64, D(7:6). Ramp-down step can be controlled by Page 0 Register 64, D(5:4). Default is ramp-down by every  $f_s$  cycle with –4-dB step.

#### 8.3.5.5 Analog Gain Control

Analog gain control can be selected between 2- $V_{rms}$  FS (0dB) or 1- $V_{rms}$  FS (–6 dB). Gain is controlled through hardware by the AGNS pin, and through software (SPI/I<sup>2</sup>C), Page 1, Register 2, D4(L-ch) / D0(R-ch).

## 8.3.6 Reset and System Clock Functions

### 8.3.6.1 Clocking Overview

The PCM512x devices have flexible systems for clocking. Internally, the device requires a number of clocks, mostly at related clock rates to function correctly. All of these clocks can be derived from the serial audio interface in one form or another.

Figure 62. Audio Flow with Respective Clocks

As shown in Figure 62 the data flows at the sample rate ( $f_s$ ). Once the data is brought into the serial audio interface, it gets processed, interpolated and modulated all the way to  $128 \times f_s$  before arriving at the current segments for the final digital to analog conversion.

The clock tree is shown in Figure 63.

Figure 63. PCM512x Clock Distribution Tree

The serial audio interface typically has 4 connections: SCK (system master clock), BCK (bit clock), LRCK (left right word clock), and DIN (data). The device has an internal PLL that is used to take either SCK or BCK and create the higher rate clocks required by the interpolating processor and the DAC clock. This allows the device to operate with or without an external SCK.

In situations where the highest audio performance is required, it is suggested that the SCK is brought to the device, along with BCK and LRCK. The device should be configured so that the PLL is only providing a clock source to the audio processing block. By ensuring that the DACCK (DAC Clock) is being driven by the external SCK source, jitter evident in the PLL (in all PLLs) is kept out of the DAC, charge pump, and oversampling system.

Everything else should be a division of the incoming SCK. This is done by setting DAC CLK Source Mux (SDAC in [Figure 63](#)) to use SCK as a source, rather than the output of the SCK/PLL Mux. Code examples for this are available in [SLASE12](#).

When the Auto Clock Configuration bit is set (Page 0/ Register 0x25), no additional clocks configuration is required. However, when setting custom PLL values and so forth, the target output rates should match those shown in the recommended PLL values of [Table 131](#).

### 8.3.6.2 Clock Slave Mode With Master and System Clock (SCK) Input (4 Wire I<sup>2</sup>S)

The PCM512x requires a system clock to operate the digital interpolation filters and advanced segment DAC modulators. The system clock is applied at the SCK input and supports up to 50 MHz. The PCM512x system-clock detection circuit automatically senses the system-clock frequency. Common audio sampling frequencies in the bands of 8 kHz, 16 kHz, (32 kHz - 44.1 kHz - 48 kHz), (88.2kHz - 96kHz), (176.4 kHz - 192 kHz), and 384 kHz with  $\pm 4\%$  tolerance are supported. Values in the parentheses are grouped when detected, (for example, 88.2 kHz and 96 kHz are detected as *double rate*, and 32 kHz, 44.1 kHz and 48 kHz are detected as *single rate*.)

In the presence of a valid bit SCK, BCK and LRCK in software mode, the device will auto-configure the clock tree and PLL to drive the miniDSP as required.

The sampling frequency detector sets the clock for the digital filter, Delta Sigma Modulator (DSM) and the Negative Charge Pump (NCP) automatically. [Table 32](#) shows examples of system clock frequencies for common audio sampling rates.

SCK rates that are not common to standard audio clocks, between 1 MHz and 50 MHz, are only supported in software mode by configuring various PLL and clock-divider registers. This programmability allows the device to become a clock master and drive the host serial port with LRCK and BCK, from a non-audio related clock (for example, using 12 MHz to generate 44.1 kHz [LRCK] and 2.8224 MHz [BCK]).

**Table 32. System Master Clock Inputs for Audio Related Clocks**

| SAMPLING<br>FREQUENCY | SYSTEM CLOCK FREQUENCY (f <sub>SCK</sub> ) (MHz) |                        |                       |                    |                    |                    |                    |                     |                     |                     |                     |                     |

(1) This system clock rate is not supported for the given sampling frequency.

(2) This system clock rate is supported by PLL mode.

See for clock timing requirements.

### 8.3.6.3 Clock Slave Mode With BCK PLL to Generate Internal Clocks (3-Wire PCM)

The system clock PLL mode allows designers to use a simple 3-wire I<sup>2</sup>S audio source. The 3-wire source reduces the need for a high frequency SCK, making PCB layout easier, and reduces high frequency electromagnetic interference.

In hardwired mode, the internal PLL is disabled as soon as an external SCK is supplied.

In hardwired mode, the device starts up expecting an external SCK input, but if BCK and LRCK start correctly while SCK remains at ground level for 16 successive LRCK periods, then the internal PLL starts, automatically generating an internal SCK from the BCK reference. Specific BCK rates are required to generate an appropriate master clock. [Table 33](#) describes the minimum and maximum BCK per LRCK for the integrated PLL to automatically generate an internal SCK.

In software mode, the user must set all the PLL registers and clock divider registers for referencing BCK. See [Clock Generation Using the PLL](#) for more information. Recommended values can be found in [Table 131](#).

**Table 33. BCK Rates (MHz) by LRCK Sample Rate for PCM512x PLL Operation**

| SAMPLE F (kHz) | BCK (f <sub>s</sub> ) |        |
|----------------|-----------------------|--------|
|                | 32                    | 64     |
| 8              | –                     | –      |
| 16             | –                     | 1.024  |
| 32             | 1.024                 | 2.048  |
| 44.1           | 1.4112                | 2.8224 |
| 48             | 1.536                 | 3.072  |
| 96             | 3.072                 | 6.144  |
| 192            | 6.144                 | 12.288 |
| 384            | 12.288                | 24.576 |

### 8.3.6.4 Clock Generation Using the PLL

The PCM512x supports a wide range of options to generate the required clocks for the DAC section as well as interface and other control blocks as shown in [Figure 63](#).

The clocks for the PLL require a source reference clock. This clock is sourced as the incoming BCK or SCK. In software mode, a GPIO can also be used.

The source reference clock for the PLL reference clock is selected by programming the SRCREF value on Page 0, Register 13, D(6:4). The PCM512x provides several programmable clock dividers to achieve a variety of sampling rates for the DAC and clocks for the NCP, OSR, and the audio processor. OSRCK for OSR must be set at 16 f<sub>s</sub> frequency by DOSR on Page0, Register 30, D(6:0). See [Figure 63](#).

If PLL functionality is not required, set the PLEN value on Page 0, Register 4, D(0) to 0. In this situation, an external SCK is required.

**Table 34. PLL Configuration Registers**

| CLOCK MULTIPLEXER | FUNCTION                      | BITS                        |
|-------------------|-------------------------------|-----------------------------|
| SRCREF            | PLL reference                 | Page 0, Register 13, D(6:4) |
| DIVIDER           | FUNCTION                      | BITS                        |
| DDSP              | audio processor clock divider | Page 0, Register 27, D(6:0) |
| DACCK             | DAC clock divider             | Page 0, Register 28, D(6:0) |
| CPCCK             | NCP clock divider             | Page 0, Register 29, D(6:0) |
| OSRCK             | OSR clock divider             | Page 0, Register 30, D(6:0) |
| DBCK              | External BCK Div              | Page 0, Register 32, D(6:0) |
| DLRK              | External LRCK Div             | Page 0, Register 33, D(7:0) |

### 8.3.6.5 PLL Calculation

The PCM512x has an on-chip PLL with fractional multiplication to generate the clock frequency needed by the audio DAC, Negative Charge Pump, Modulator and Digital Signal Processing blocks. The programmability of the PLL allows operation from a wide variety of clocks that may be available in the system. The PLL input (PLLCKIN) supports clock frequencies from 1 MHz to 50 MHz and is register programmable to enable generation of required sampling rates with fine precision.

The PLL is enabled by default. The PLL can be turned on by writing to Page 0, Register 4, D(0). When the PLL is enabled, the PLL output clock PLLCK is given by [Equation 3](#).

$$\text{PLLCK} = \frac{\text{PLLCKIN} \times R \times J.D}{P} \quad \text{or} \quad \text{PLLCK} = \frac{\text{PLLCKIN} \times R \times K}{P}$$

where

- R = 1, 2, 3, 4, ... , 15, 16
  - J = 4, 5, 6, ... 63, and D = 0000, 0001, 0002, ... 9999
  - K = [J value].[D value]
  - P = 1, 2, 3, ... 15
- (3)

R, J, D, and P are programmable. J is the integer portion of K (the numbers to the left of the decimal point), while D is the fractional portion of K (the numbers to the right of the decimal point, assuming four digits of precision).

#### 8.3.6.5.1 Examples:

- If K = 8.5, then J = 8, D = 5000
- If K = 7.12, then J = 7, D = 1200
- If K = 14.03, then J = 14, D = 0300
- If K = 6.0004, then J = 6, D = 0004

When the PLL is enabled and D = 0000, the following conditions must be satisfied:

- 1 MHz ≤ ( PLLCKIN / P ) ≤ 20 MHz
- 64 MHz ≤ (PLLCKIN × K × R / P ) ≤ 100 MHz (in VREF mode)
- 72 MHz ≤ (PLLCKIN × K × R / P ) ≤ 86 MHz (in VCOM mode)
- 1 ≤ J ≤ 63

When the PLL is enabled and D ≠ 0000, the following conditions must be satisfied:

- 6.667 MHz ≤ PLLCKIN / P ≤ 20 MHz
- 64 MHz ≤ (PLLCKIN × K × R / P ) ≤ 100 MHz (in VREF mode)
- 72 MHz ≤ (PLLCKIN × K × R / P ) ≤ 86 MHz (in VCOM mode)
- 4 ≤ J ≤ 11
- R = 1

When the PLL is enabled,

- $f_s = (\text{PLLCKIN} \times K \times R) / (2048 \times P)$
- The value of N is selected so that  $f_s \times N = \text{PLLCKIN} \times K \times R / P$  is in the allowable range.

**Example:** MCLK = 12 MHz and  $f_s = 44.1$  kHz, (N=2048)

Select P = 1, R = 1, K = 7.5264, which results in J = 7, D = 5264

**Example:** MCLK = 12 MHz and  $f_s = 48.0$  kHz, (N=2048)

Select P = 1, R = 1, K = 8.192, which results in J = 8, D = 1920

Values are written to the registers in [Table 35](#).

#### 8.3.6.5.1.1 Recommended PLL Settings

Recommended values for the PLL can be found after the register descriptions in this data sheet. Different values are defined based on the device configuration for VREF or VCOM mode.

Other configurations are possible, at your own risk.

Below are details of the register locations, as well as the nomenclature for the table of registers found at the end of this document.

**Table 35. PLL Registers**

| DIVIDER | FUNCTION   | BITS                        |
|---------|------------|-----------------------------|
| PLLE    | PLL enable | Page 0, Register 4, D(0)    |
| PPDV    | PLL P      | Page 0, Register 20, D(3:0) |
| PJDV    | PLL J      | Page 0, Register 21, D(5:0) |
| PDDV    | PLL D      | Page 0, Register 22, D(5:0) |
|         |            | Page 0, Register 23, D(7:0) |
| PRDV    | PLL R      | Page 0, Register 24, D(3:0) |

**Table 36. PLL Configuration Recommendations**

| COLUMN           | DESCRIPTION                                                                                                                                                                                                                                                                                                       |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| $f_s$ (kHz)      | Sampling frequency                                                                                                                                                                                                                                                                                                |
| RSCK             | Ratio between sampling frequency and SCK frequency (SCK frequency = RSCK $\times$ sampling frequency)                                                                                                                                                                                                             |
| SCK (MHz)        | System master clock frequency at SCK input (pin 20)                                                                                                                                                                                                                                                               |
| PLL VCO (MHz)    | PLL VCO frequency as PLLCK in <a href="#">Figure 63</a>                                                                                                                                                                                                                                                           |
| P                | One of the PLL coefficients in <a href="#">Equation 3</a>                                                                                                                                                                                                                                                         |
| PLL REF (MHz)    | Internal reference clock frequency which is produced by SCK / P                                                                                                                                                                                                                                                   |
| $M = K \times R$ | The final PLL multiplication factor computed from K and R as described in <a href="#">Equation 3</a>                                                                                                                                                                                                              |
| $K = J \cdot D$  | One of the PLL coefficients in <a href="#">Equation 3</a>                                                                                                                                                                                                                                                         |
| R                | One of the PLL coefficients in <a href="#">Equation 3</a>                                                                                                                                                                                                                                                         |
| PLL $f_s$        | Ratio between $f_s$ and PLL VCO frequency (PLL VCO / $f_s$ )                                                                                                                                                                                                                                                      |
| DSP $f_s$        | Ratio between audio processor operating clock rate and $f_s$ (PLL $f_s$ / NMAC)                                                                                                                                                                                                                                   |
| NMAC             | The audio processor clock divider value in <a href="#">Table 34</a>                                                                                                                                                                                                                                               |
| DSP CLK (MHz)    | The audio processor operating frequency as DSPCK in <a href="#">Figure 63</a>                                                                                                                                                                                                                                     |
| MOD $f_s$        | Ratio between DAC operating clock frequency and $f_s$ (PLL $f_s$ / NDAC)                                                                                                                                                                                                                                          |
| MOD f (kHz)      | DAC operating frequency as DACCK in <a href="#">Figure 63</a>                                                                                                                                                                                                                                                     |
| NDAC             | DAC clock divider value in <a href="#">Table 34</a>                                                                                                                                                                                                                                                               |
| DOSR             | OSR clock divider value in <a href="#">Table 34</a> for generating OSRCK in <a href="#">Figure 63</a> . DOSR must be chosen so that MOD $f_s$ / DOSR = 16 for correct operation.                                                                                                                                  |
| NCP              | NCP (negative charge pump) clock divider value in <a href="#">Table 34</a>                                                                                                                                                                                                                                        |
| CP f             | Negative charge pump clock frequency ( $f_s \times \text{MOD } f_s / \text{NCP}$ )                                                                                                                                                                                                                                |
| % Error          | Percentage of error between PLL VCO / PLL $f_s$ and $f_s$ (mismatch error). <ul style="list-style-type: none"> <li>This number is typically zero but can be non-zero especially when K is not an integer (D is not zero).</li> <li>This number may be non-zero only when the PCM512x acts as a master.</li> </ul> |

### 8.3.6.6 Clock Master Mode from Audio Rate Master Clock

In Master Mode, the device generates bit clock (BCK) and left-right clock (LRCK) and outputs them on the appropriate pins. To configure the device in this mode, first put the device into reset, then use registers BCKO and LRKO (Pg 0, Reg 9 0x09). Then reset the LRCK and BCK divider counters using bits RBCK and RLRK (Pg 0, Reg 12 0x0C). Finally, exit reset.

An example of this is given in register programming examples in the PCM5242 data sheet ([SLASE12](#).)

[Figure 64](#) shows a simplified serial port clock tree for the device in master mode.

**Figure 64. Simplified Clock Tree for SCK Sourced Master Mode**

In master mode, SCK is an input and BCK/LRCK are outputs. BCK and LRCK are integer divisions of SCK. Master mode with a non-audio rate master clock source will require external GPIOs to use the PLL in standalone mode.

The PLL will also need to be configured to ensure that the onchip audio processor processor can be driven at its maximum clock rate.

Register changes that need to be done include switching the device into master mode, and setting the divider ratio.

Here is an example of using 24.576 MCLK as a master clock source and driving the BCK and LRCK with integer dividers to create 48 kHz.

In this mode, the DAC section of the device is also running from the PLL output. While the PLL inside the PCM512x is one that has been specified to achieve the stated performance, using the SCK CMOS Oscillator source will have less jitter.

To switch the DAC clocks (SDAC in the [Figure 63](#)) the following registers should be modified.

- Clock Tree Flex Mode (Page 253, Registers 0x3F and 0x40)
- DAC and OSR Source Clock Register (Page 0, Reg 14) – set to 0x30 (SCK input, and OSR is set to whatever the DAC source is)
- The DAC clock divider should be  $16 F_S$ .
  - $16 \times 48 \text{ kHz} = 768 \text{ kHz}$
  - $24.576 \text{ MHz (SCK in)} / 768 \text{ kHz} = 32$
  - Therefore, divide ratio for register DDAC (Page 0, Reg 28 0x1C) should be set to 32. The may the register is mapped gives  $0x00 = 1$ , so 32 must be converted to 0x1F.

An example configuration can be found in the PCM5242 data sheet ([SLASE12](#)).

### 8.3.6.7 Clock Master from a Non-Audio Rate Master Clock

The classic example here is running a 12-MHz Master clock for a 48-kHz sampling system. Given the clock tree for the device (shown in Figure 63), a non-audio clock rate cannot be brought into the SCK to the PLL in master mode. Therefore, the PLL source must be configured to be a GPIO pin, and the output brought back into another GPIO pin.

Figure 65. Application Diagram for Using Non-Audio Clock Sources to Generate Audio Clocks

The clock flow through the system is shown in Figure 65. The newly-generated SCK must be brought out of the device on a GPIO pin, then brought into the SCK pin for integer division to create BCK and LRCK outputs.

#### NOTE

Pullup resistors must be used on BCK and LRCK in this mode to ensure the device does not go into sleep mode.

A code example for configuring this mode is provided in the PCM5242 data sheet (SLASE12).

## 8.4 Device Functional Modes

### 8.4.1 Choosing a Control Mode

**SPI** Mode is selected by connecting MODE1 to DVDD. SPI Mode uses four signal lines and allows higher-speed full-duplex communication between the host and the PCM512x device.

**I<sup>2</sup>C** Mode is selected by connecting MODE1 to DGND and Mode2 to DVDD. I<sup>2</sup>C uses two signal lines for half-duplex communication, and is widely used in a variety of devices.

**Hardware** Control Mode is selected by connecting both MODE1 and MODE2 pins to DGND. Hardware control is useful in applications that do not require on-the-fly device-reconfiguration changes in operating features such as gain or filter latency selection.

See for a comparison of pin assignments for the 28-pin TSSOP.

#### 8.4.1.1 Software Control

##### 8.4.1.1.1 SPI Interface

The SPI interface is a 4-wire synchronous serial port which operates asynchronously to the serial audio interface and the system clock (SCK). The serial control interface is used to program and read the on-chip mode registers.

The control interface includes MISO (pin 24), MOSI (pin 11), MC (pin 12), and MS (pin 18). MISO (Master In Slave Out) is the serial data output, used to read back the values of the mode registers; MOSI (Master Out Slave In) is the serial data input, used to program the mode registers.

## Device Functional Modes (continued)

MC is the serial bit clock, used to shift data in and out of the control port by falling edge of MC, and MS is the mode control enable with LOW active, used to enable the internal mode register access. If feedback from the device is not required, the MISO pin can be assigned to GPIO1 by register control.

### 8.4.1.1.1.1 Register Read and Write Operation

All read/write operations for the serial control port use 16-bit data words. Figure 66 shows the control data word format. The most significant bit is the read/write bit. For write operations, the bit must be set to 0. For read operations, the bit must be set to 1. There are seven bits, labeled ID<sub>X</sub>[6:0], that hold the register index (or address) for the read and write operations. The least significant eight bits, D[7:0], contain the data to be written to, or the data that was read from, the register specified by ID<sub>X</sub>[6:0].

Figure 66 and Figure 67 show the functional timing diagram to write or read through the serial control port. MS is held at a logic-1 state until a register access. To start the register write or read cycle, set MS to logic 0. Sixteen clocks are then provided on MC, corresponding to the 16 bits of the control data word on MOSI and read-back data on MISO. After the eighth clock cycle has completed, the data from the indexed-mode control register appears on MISO during the read operation. After the sixteenth clock cycle has completed, the data is latched into the indexed-mode control register during the write operation. To write or read subsequent data, MS is set to logic 1 once (see  $t_{MHH}$  in Figure 71).

**Figure 66. Control Data Word Format; MDI**

#### NOTE

B8 is used for selection of *Write* or *Read*. Setting = 0 indicates a *Write*, while = 1 indicates a *Read*. Bits 15–9 are used for register address. Bits 7–0 are used for register data. Multiple-byte write or read (up to 8 bytes) is supported while MS is kept low. The address field becomes the initial address, automatically incrementing for each byte.

**Figure 67. Serial Control Format; Write, Single Byte**

## Device Functional Modes (continued)

**Figure 68. Serial Control Format; Write, Multiple Byte**

**Figure 69. Serial Control Format; Read**

**Figure 70. Serial Control Format; Read, Multiple Byte**

**Device Functional Modes (continued)**

**Figure 71. Control Interface Timing**
**Table 37. Control Interface Timing**

|           |                                          | MIN | MAX | UNIT |
|-----------|------------------------------------------|-----|-----|------|
| $t_{MCY}$ | MC Pulse Cycle Time                      | 100 |     | ns   |
| $t_{MCL}$ | MC Low Level Time                        | 40  |     | ns   |
| $t_{MCH}$ | MC High Level Time                       | 40  |     | ns   |
| $t_{MHH}$ | $\overline{MS}$ High Level Time          | 20  |     | ns   |
| $t_{MSS}$ | $\overline{MS}$ ↓ Edge to MC ↑ Edge      | 30  |     | ns   |
| $t_{MSH}$ | $\overline{MS}$ Hold Time <sup>(1)</sup> | 30  |     | ns   |
| $t_{MDH}$ | MDI Hold Time                            | 15  |     | ns   |
| $t_{MDS}$ | MDI Set-up Time                          | 15  |     | ns   |
| $t_{MOS}$ | MC Rise Edge to MDO Stable               |     | 20  | ns   |

(1) MC falling edge for LSB to MS rising edge.

#### 8.4.1.1.2 I<sup>2</sup>C Interface

The PCM512x supports the I<sup>2</sup>C serial bus and the data transmission protocol for standard and fast mode as a slave device.

In I<sup>2</sup>C mode, the control terminals are changed as follows.

**Table 38. I<sup>2</sup>C Pins and Functions**

| SIGNAL | PIN | I/O | DESCRIPTION                |
|--------|-----|-----|----------------------------|
| SDA    | 11  | I/O | I <sup>2</sup> C data      |
| SCL    | 12  | I   | I <sup>2</sup> C clock     |
| ADR2   | 16  | I   | I <sup>2</sup> C address 2 |
| ADR1   | 24  | I   | I <sup>2</sup> C address 1 |

##### 8.4.1.1.2.1 Slave Address

**Table 39. I<sup>2</sup>C Slave Address**

| MSB |   |   |   |   |      |      | LSB               |
|-----|---|---|---|---|------|------|-------------------|
| 1   | 0 | 0 | 1 | 1 | ADR2 | ADR1 | R/ $\overline{W}$ |

The PCM512x has 7 bits for its own slave address. The first five bits (MSBs) of the slave address are factory preset to 10011 (0x9x). The next two bits of the address byte are the device select bits which can be user-defined by the ADR1 and ADR0 terminals. A maximum of four devices can be connected on the same bus at one time. This gives a range of 0x98, 0x9A, 0x9C and 0x9E. Each PCM512x responds when it receives its own slave address.

##### 8.4.1.1.2.2 Register Address Auto-Increment Mode

**Figure 72. Auto Increment Mode**

Auto-increment mode allows multiple sequential register locations to be written to or read back in a single operation, and is especially useful for block write and read operations.

##### 8.4.1.1.2.3 Packet Protocol

A master device must control packet protocol, which consists of start condition, slave address, read/write bit, data if write or acknowledge if read, and stop condition. The PCM512x supports only slave receivers and slave transmitters.

**Figure 73. Packet Protocol**

**Table 40. Write Operation - Basic I<sup>2</sup>C Framework**

|             |    |               |    |     |      |     |      |     |  |     |    |
|-------------|----|---------------|----|-----|------|-----|------|-----|--|-----|----|
| Transmitter | M  | M             | M  | S   | M    | S   | M    | S   |  | S   | M  |
| Data Type   | St | slave address | R/ | ACK | DATA | ACK | DATA | ACK |  | ACK | Sp |

**Table 41. Read Operation - Basic I<sup>2</sup>C Framework**

|             |    |               |    |     |      |     |      |     |  |      |    |
|-------------|----|---------------|----|-----|------|-----|------|-----|--|------|----|
| Transmitter | M  | M             | M  | S   | S    | M   | S    | M   |  | M    | M  |
| Data Type   | St | slave address | R/ | ACK | DATA | ACK | DATA | ACK |  | NACK | Sp |

M = Master Device; S = Slave Device; St = Start Condition; Sp = Stop Condition

#### 8.4.1.1.2.4 Write Register

A master can write to any PCM512x registers using single or multiple accesses. The master sends a PCM512x slave address with a write bit, a register address with auto-increment bit, and the data. If auto-increment is enabled, the address is that of the starting register, followed by the data to be transferred. When the data is received properly, the index register is incremented by 1 automatically. When the index register reaches 0x7F, the next value is 0x0. [Table 42](#) shows the write operation.

**Table 42. Write Operation**

|             |    |            |   |     |     |          |     |              |     |              |     |  |     |    |
|-------------|----|------------|---|-----|-----|----------|-----|--------------|-----|--------------|-----|--|-----|----|
| Transmitter | M  | M          | M | S   | M   |          | S   | M            | S   | M            | S   |  | S   | M  |
| Data Type   | St | slave addr | W | ACK | inc | reg addr | ACK | write data 1 | ACK | write data 2 | ACK |  | ACK | Sp |

M = Master Device; S = Slave Device; St = Start Condition; Sp = Stop Condition; W = Write; ACK = Acknowledge

#### 8.4.1.1.2.5 Read Register

A master can read the PCM512x register. The value of the register address is stored in an indirect index register in advance. The master sends a PCM512x slave address with a read bit after storing the register address. Then the PCM512x transfers the data which the index register points to. When auto-increment is enabled, the index register is incremented by 1 automatically. When the index register reaches 0x7F, the next value is 0x0. [Table 43](#) shows the read operation.

**Table 43. Read Operation**

|             |    |            |   |     |     |          |     |    |            |   |     |      |     |  |      |    |
|-------------|----|------------|---|-----|-----|----------|-----|----|------------|---|-----|------|-----|--|------|----|
| Transmitter | M  | M          | M | S   | M   |          | S   | M  | M          | M | S   | S    | M   |  | M    | M  |
| Data Type   | St | slave addr | W | ACK | inc | reg addr | ACK | Sr | slave addr | R | ACK | data | ACK |  | NACK | Sp |

M = Master Device; S = Slave Device; St = Start Condition; Sr = Repeated Start Condition; Sp = Stop Condition; W = Write; R = Read; NACK = Not acknowledge

#### 8.4.1.1.2.6 Timing Characteristics

**Figure 74. Register Access Timing**

**Table 44. I<sup>2</sup>C Bus Timing**

|                     |                                                                                       |          | MIN                    | MAX  | UNIT |
|---------------------|---------------------------------------------------------------------------------------|----------|------------------------|------|------|
| f <sub>SCL</sub>    | SCL clock frequency                                                                   | Standard |                        | 100  | kHz  |
|                     |                                                                                       | Fast     |                        | 400  | kHz  |
| t <sub>BUF</sub>    | Bus free time between a STOP and START condition                                      | Standard | 4.7                    |      | μs   |
|                     |                                                                                       | Fast     | 1.3                    |      |      |
| t <sub>LOW</sub>    | Low period of the SCL clock                                                           | Standard | 4.7                    |      | μs   |
|                     |                                                                                       | Fast     | 1.3                    |      |      |
| t <sub>HI</sub>     | High period of the SCL clock                                                          | Standard | 4.0                    |      | μs   |
|                     |                                                                                       | Fast     | 600                    |      | ns   |
| t <sub>RS-SU</sub>  | Setup time for (repeated)START condition                                              | Standard | 4.7                    |      | μs   |
|                     |                                                                                       | Fast     | 600                    |      | ns   |
| t <sub>S-HD</sub>   | Hold time for (repeated)START condition                                               | Standard | 4.0                    |      | μs   |
| t <sub>RS-HD</sub>  |                                                                                       | Fast     | 600                    |      | ns   |
| t <sub>D-SU</sub>   | Data setup time                                                                       | Standard | 250                    |      | ns   |
|                     |                                                                                       | Fast     | 100                    |      |      |
| t <sub>D-HD</sub>   | Data hold time                                                                        | Standard | 0                      | 900  | ns   |
|                     |                                                                                       | Fast     | 0                      | 900  |      |
| t <sub>SCL-R</sub>  | Rise time of SCL signal                                                               | Standard | 20 + 0.1C <sub>B</sub> | 1000 | ns   |
|                     |                                                                                       | Fast     | 20 + 0.1C <sub>B</sub> | 300  |      |
| t <sub>SCL-R1</sub> | Rise time of SCL signal after a repeated START condition and after an acknowledge bit | Standard | 20 + 0.1C <sub>B</sub> | 1000 | ns   |
|                     |                                                                                       | Fast     | 20 + 0.1C <sub>B</sub> | 300  |      |
| t <sub>SCL-F</sub>  | Fall time of SCL signal                                                               | Standard | 20 + 0.1C <sub>B</sub> | 1000 | ns   |
|                     |                                                                                       | Fast     | 20 + 0.1C <sub>B</sub> | 300  |      |
| t <sub>SDA-R</sub>  | Rise time of SDA signal                                                               | Standard | 20 + 0.1C <sub>B</sub> | 1000 | ns   |
|                     |                                                                                       | Fast     | 20 + 0.1C <sub>B</sub> | 300  |      |
| t <sub>SDA-F</sub>  | Fall time of SDA signal                                                               | Standard | 20 + 0.1C <sub>B</sub> | 1000 | ns   |
|                     |                                                                                       | Fast     | 20 + 0.1C <sub>B</sub> | 300  |      |
| t <sub>P-SU</sub>   | Setup time for STOP condition                                                         | Standard | 4.0                    |      | μs   |
|                     |                                                                                       | Fast     | 600                    |      | ns   |
| C <sub>B</sub>      | Capacitive load for SDA and SCL line                                                  |          |                        | 400  | pF   |
| t <sub>SP</sub>     | Pulse width of spike suppressed                                                       | Fast     |                        | 50   | ns   |
| V <sub>NH</sub>     | Noise margin at High level for each connected device (including hysteresis)           |          | 0.2 × V <sub>DD</sub>  |      | V    |

### 8.4.2 VREF and VCOM Modes

See [Choosing Between VREF and VCOM Modes](#) for information on configuring these modes.

## 8.5 Programming

In software mode, the PCM512x can act as an I<sup>2</sup>S master, generating BCK and LRCK as outputs from the SCK input.

**Table 45. I<sup>2</sup>S Master Mode Registers**

| REGISTER                                | FUNCTION                            |
|-----------------------------------------|-------------------------------------|
| Page0, Register 9, D(0), D(4), and D(5) | I <sup>2</sup> S Master mode select |
| Register 32, D(6:0)                     | BCK divider and LRCK divider        |
| Register 33, D(7:0)                     |                                     |

## 9 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 9.1 Application Information

The PCM512x family is flexible, and this flexibility gives rise to a number of design questions that define the design requirements for a given application.

### 9.2 Typical Application

**Figure 75. Simplified Schematic, Hardware-Controlled Subsystem**

#### 9.2.1 Design Requirements

- Single-ended 2.1-V<sub>RMS</sub> analog outputs
- 3-wire I²S interface (BCK PLL)
- Single 3.3-V supply

#### 9.2.2 Detailed Design Procedure

- Clock and PLL setup (See [Reset and System Clock Functions](#).) Ensure incoming BCK meets minimum requirements.
- XSMT pin setup for 12-V monitoring (See [External Power Sense Undervoltage Protection Mode](#).)
- Single-supply 3.3-V operation (See [Setting Digital Power Supplies and I/O Voltage Rails](#).)

## Typical Application (continued)

### 9.2.3 Application Curve

**Figure 76. PCM5121A FFT Plot, DC to 20 kHz With a 1-kHz, -60-dBFS Input**

## 10 Power Supply Recommendations

### 10.1 Power Supply Distribution and Requirements

The PCM512x devices are powered through the pins shown in [Figure 77](#).

**Figure 77. Power Distribution Tree Within PCM512x**

**Table 46. Power Supply Pin Descriptions**

| NAME  | USAGE / DESCRIPTION                                                                                                                                                                    |
|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AVDD  | Analog voltage supply; must be 3.3 V. This powers all analog circuitry that the DAC runs on.                                                                                           |
| DVDD  | Digital voltage supply. This is used as the I/O voltage control and the input to the onchip LDO.                                                                                       |
| CPVDD | Charge Pump Voltage Supply - must be 3.3 V                                                                                                                                             |
| LDOO  | Output from the onchip LDO. Should be used with a 0.1-μF decoupling cap. Can be driven (used as power input) with a 1.8-V supply to bypass the onchip LDO for lower power consumption. |
| AGND  | Analog ground                                                                                                                                                                          |
| DGND  | Digital ground                                                                                                                                                                         |

### 10.2 Recommended Powerdown Sequence

Under certain conditions, the PCM512x devices can exhibit some pops on power down. Pops are caused by a device not having enough time to detect power loss and start the muting process.

The PCM512x devices have two auto-mute functions to mute the device upon power loss (intentional or unintentional).

#### 10.2.1 XSMT = 0

When the XSMT pin is pulled low, the incoming PCM data is attenuated to 0, closely followed by a hard analog mute. This process takes 150 sample times ( $t_s$ ) + 0.2 ms.

Because this mute time is mainly dominated by the sampling frequency, systems sampling at 192 kHz will mute much faster than a 48-kHz system.

#### 10.2.2 Clock Error Detect

When clock error is detected on the incoming data clock, the PCM512x devices switch to an internal oscillator, and continue to drive the output, while attenuating the data from the last known value. Once this process is complete, the PCM512x outputs are hard muted to ground.

## Recommended Powerdown Sequence (continued)

### 10.2.3 Planned Shutdown

These auto-muting processes can be manipulated by system designs to mute before power loss in the following ways:

1. Assert XSMT low  $150 t_S + 0.2$  ms before power is removed.

**Figure 78. Assert XSMT**

2. Stop I<sup>2</sup>S clocks (SCK, BCK, LRCK) 3 ms before powerdown as shown in [Figure 79](#).

**Figure 79. Stop I<sup>2</sup>C Clocks**

### 10.2.4 Unplanned Shutdown

Many systems use a low-noise regulator to provide an AVDD 3.3-V supply for the DAC. The XSMT Pin can take advantage of such a feature to measure the pre-regulated output from the system SMPS to mute the output before the entire SMPS discharges. [Figure 80](#) shows how to configure such a system to use the XSMT pin. The XSMT pin can also be used in parallel with a GPIO pin from the system microcontroller/DSP or power supply.

## Recommended Powerdown Sequence (continued)

**Figure 80. Using the XSMT Pin**

## 10.3 External Power Sense Undervoltage Protection Mode

### NOTE

External Power Sense Undervoltage Protection Mode is supported only when  $DV_{DD} = 3.3\text{ V}$ .

The XSMT pin can also be used to monitor a system voltage, such as the 24-VDC LCD TV backlight, or 12-VDC system supply using a voltage divider created with two resistors. (See [Figure 81](#).)

- If the XSMT pin makes a transition from 1 to 0 over 6 ms or more, the device switches into external undervoltage protection mode. This mode uses two trigger levels:
  - When the XSMT pin level reaches 2 V, soft mute process begins.
  - When the XSMT pin level reaches 1.2 V, analog mute engages, regardless of digital audio level, and analog shutdown begins. (DAC and related circuitry powers down).

If XSMT is moved from 1 to 0 in 20 ns or less, then the device will interpret it as a digital controlled request to mute. It will perform a soft mute, then move to standby.

A timing diagram to show this is shown in [Figure 82](#).

### NOTE

The XSMT input pin voltage range is from  $-0.3\text{ V}$  to  $DV_{DD} + 0.3\text{ V}$ . The ratio of external resistors must produce a voltage within this input range. Any increase in power supply (such as power supply positive noise or ripple) can pull the XSMT pin higher than  $DV_{DD} + 0.3\text{ V}$ .

For example, if the PCM512x is monitoring a 12-V input, and dividing the voltage by 4, then the voltage at XSMT during ideal power supply conditions is 3.3 V. A voltage spike higher than 14.4 V causes a voltage greater than 3.6 V ( $DV_{DD} + 0.3$ ) on the XSMT pin, potentially damaging the device.

Providing the divider is set appropriately, any DC voltage can be monitored.

## External Power Sense Undervoltage Protection Mode (continued)

**Figure 81. XSMT in External UVP Mode**

**Figure 82. XSMT Timing for Undervoltage Protection**

The trigger voltage values for the soft mute and hard mute are shown in [Table 47](#). The range of values will vary from device to device, but typical thresholds are shown. XSMT should be set up to nominally be 3.3 V along with DVDD, but derived from a higher system power supply rail.

**Table 47. Distribution of Voltage Thresholds**

|                             | MIN                      | TYP | MAX                      | UNIT |
|-----------------------------|--------------------------|-----|--------------------------|------|
| Soft Mute Threshold Voltage | 2                        | 2.2 | $0.9 \times \text{DVDD}$ | V    |
| Hard Mute Threshold Voltage | $0.1 \times \text{DVDD}$ | 0.9 | 1.2                      | V    |

## 10.4 Power-On Reset Function

### 10.4.1 Power-On Reset, DVDD 3.3-V Supply

The PCM512x includes a power-on reset function, as shown in [Figure 83](#). With  $V_{DD} > 2.8$  V, the power-on reset function is enabled. After the initialization period, the PCM512x is set to its default reset state. Analog output will begin ramping after valid data has been passing through the device for the given group delay given by the digital interpolation filter selected.

**Figure 83. Power-On Reset Timing, DVDD = 3.3 V**

### 10.4.2 Power-On Reset, DVDD 1.8-V Supply

The PCM512x includes a power-on reset function, as shown in [Figure 84](#). With AVDD greater than approximately 2.8 V, CPVDD greater than approximately 2.8 V, and DVDD greater than approximately 1.5 V, the power-on reset function is enabled. After the initialization period, the PCM512x is set to its default reset state.

**Figure 84. Power-On Reset Timing, DVDD = 1.8 V**

## 10.5 PCM512x Power Modes

### 10.5.1 Setting Digital Power Supplies and I/O Voltage Rails

The internal digital core of the PCM512x devices run from a 1.8-V supply. This can be generated by the internal LDO, or by an external 1.8-V supply.

DVDD is used to set the I/O voltage, and to be used as the input to the onchip LDO that creates the 1.8 V required by the digital core.

For systems that require 3.3-V I/O support, but lower power consumption, DVDD should be connected to 3.3 V and LDOO can be connected to an external 1.8-V source. Doing so will disable the onchip LDO.

When setting I/O voltage to be 1.8 V, both DVDD and LDOO must be provided with an external 1.8-V supply.

### 10.5.2 Power Save Modes

The PCM512x devices offer two power-save modes: standby and power-down.

When a clock error (SCK, BCK, and LRCK) or clock halt is detected, the PCM512x device automatically enters standby mode. The DAC and line driver are also powered down.

When BCK and LRCK remain at a low level for more than 1 second, the PCM512x device automatically enters powerdown mode. Power-down mode disables the negative charge pump and bias/reference circuit, in addition to those disabled in standby mode.

When expected audio clocks (SCK, BCK, LRCK) are applied to the PCM512x device, or if BCK and LRCK start correctly while SCK remains at ground level for 16 successive LRCK periods, the device starts its powerup sequence automatically.

### 10.5.3 Power Save Parameter Programming

**Table 48. Power Save Registers**

| REGISTER                          | DESCRIPTION                                                                        |
|-----------------------------------|------------------------------------------------------------------------------------|
| Page 0, Register 2, D(4)          | Software standby mode command                                                      |
| Page 0, Register 2, D(0)          | Software power-down command                                                        |
| Page 0, Register 2, D(4) and D(0) | Software power-up sequence command (required after software standby or power-down) |
| Page 0, Register 44, D(2:0)       | Detection time of BCK and LRCK halt                                                |

## 11 Layout

### 11.1 Layout Guidelines

- The PCM512x family of devices are simple to layout. Most engineers use a shared common ground for an entire device. GND can consider AGND and DGND connected.
- Good system partitioning should keep digital clock and interface traces away from the analog outputs for highest analog performance. This reduces any high-speed clock return currents influencing the analog outputs.
- Power supply and charge pump decoupling capacitors should be placed as close as possible to the device.
- The top layer should be used for routing signals, whilst the bottom layer can be used for GND.

### 11.2 Layout Example

It is recommended to place a top layer ground pour for shielding around the DAC and connect to lower main PCB ground plane by multiple vias

**Figure 85. PCM514x Layout Example**

## 12 Register Maps

### 12.1 PCM512x Register Map

In any page, register 0 is the Page Select Register. The register value selects the Register Page from 0 to 255 for next read or write command.

**Table 49. Register Map Overview**

| REGISTER NUMBER | DESCRIPTION                                                    |
|-----------------|----------------------------------------------------------------|
| <b>Page 0</b>   |                                                                |
| 0               | Page select register                                           |
| 1               | Analog control register                                        |

**PCM5121, PCM5122**

SLAS763B –AUGUST 2012–REVISED JANUARY 2016

[www.ti.com](http://www.ti.com)

The PCM512x has a register map split into multiple pages. Pages 0 and 1 control of the DAC and other on-chip peripherals. Pages 44 through 52 are used for Coefficient A memory, while Pages 62-70 are coefficient B memory. Pages 152-186 contain the miniDSP instruction memory. Page 253 is where the Clock Flex Mode register is located.

**Table 50. PCM512x Register Page Structure**

|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>RSV</b>  | <b>Reserved</b><br>Reserved. Do not access.                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>RQST</b> | <b>Standby Request</b><br>When this bit is set, the DAC will be forced into a system standby mode, which is also the mode the system enters in the case of clock errors. In this mode, most subsystems will be powered down but the charge pump and digital power supply.<br><br>Default value: 0<br>0: Normal operation<br>1: Standby mode                                                                                                                                             |
| <b>RQPD</b> | <b>Powerdown Request</b><br>When this bit is set, the DAC will be forced into powerdown mode, in which the power consumption would be minimum as the charge pump is also powered down. However, it will take longer to restart from this mode. This mode has higher precedence than the standby mode, that is, setting this bit along with bit 4 for standby mode will result in the DAC going into powerdown mode.<br><br>Default value: 0<br>0: Normal operation<br>1: Powerdown mode |

| <b>IDSK</b> | <b>Ignore SCK Detection</b><br>This bit controls whether to ignore the SCK detection against LRCK. Only some certain SCK ratios within some error margin are allowed. When ignored, an SCK error will not cause a clock error.<br>Default value: 0<br>0: Regard SCK detection<br>1: Ignore SCK detection                   |
| <b>IDCH</b> | <b>Ignore Clock Halt Detection</b>                                                                                                                                                                                                                                                                                         |

|             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|             | <p>This bit controls whether to ignore the SCK halt (static or frequency is lower than acceptable) detection. When ignored an SCK halt will not cause a clock error.</p> <p>Default value: 0</p> <p>0: Regard SCK halt detection</p> <p>1: Ignore SCK halt detection</p>                                                                                                                                                                                                                                                                                                    |
| <b>IDCM</b> | <p><b>Ignore LRCK/BCK Missing Detection</b></p> <p>This bit controls whether to ignore the LRCK/BCK missing detection. The LRCK/BCK need to be in low state (not only static) to be deemed missing. When ignored an LRCK/BCK missing will not cause the DAC go into powerdown mode.</p> <p>Default value: 0</p> <p>0: Regard LRCK/BCK missing detection</p> <p>1: Ignore LRCK/BCK missing detection</p>                                                                                                                                                                     |
| <b>DCAS</b> | <p><b>Disable Clock Divider Autoset</b></p> <p>This bit enables or disables the clock auto set mode. When dealing with uncommon audio clock configuration, the auto set mode must be disabled and all clock dividers must be set manually. Additionally, some clock detectors might also need to be disabled. The clock autoset feature will not work with PLL enabled in VCOM mode. In this case this feature has to be disabled and the clock dividers must be set manually.</p> <p>Default value: 0</p> <p>0: Enable clock auto set</p> <p>1: Disable clock auto set</p> |
| <b>IPLK</b> | <p><b>Ignore PLL Lock Detection</b></p> <p>This bit controls whether to ignore the PLL lock detection. When ignored, PLL unlocks will not cause a clock error. The PLL lock flag at Page 0 / Register 4, bit 4 is always correct regardless of this bit.</p> <p>Default value: 0</p> <p>0: PLL unlocks raise clock error</p> <p>1: PLL unlocks are ignored</p>                                                                                                                                                                                                              |

| <b>ACRM</b> |     | <b>Active CRAM Monitor (Read Only)</b><br>This bit indicates which CRAM is being accessed by the DSP when adaptive mode is disabled. When adaptive mode is enabled, this bit has no meaning.<br>0: CRAM A is being used by the DSP<br>1: CRAM B is being used by the DSP                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |     |     |     |      |      |      |      |
| <b>AMDC</b> |     | <b>Adaptive Mode Control</b><br>This bit controls the DSP adaptive mode. When in adaptive mode, only CRAM A is accessible via serial interface when the DSP is disabled (DAC in standby state), while when the DSP is enabled (DAC is run state) the CRAM A can only be accessed by the DSP and the CRAM B can only be accessed by the serial interface, or vice versa depending on the value of CRAMSTAT. When not in adaptive mode, both CRAM A and B can be accessed by the serial interface when the DSP is disabled, but when the DSP is enabled, no CRAM can be accessed by serial interface. The DSP can access either CRAM, which can be monitored at SWPMON.<br>Default value: 0<br>0: Adaptive mode disabled<br>1: Adaptive mode enabled |     |     |     |      |      |      |      |
| <b>ACRS</b> |     | <b>Active CRAM Selection (Read Only)</b><br>This bit indicates which CRAM currently serves as the active one. The other CRAM serves as an update buffer, and can accessed by serial interface (SPI/I2C)<br>0: CRAM A is active and being used by the DSP<br>1: CRAM B is active and being used by the DSP                                                                                                                                                                                                                                                                                                                                                                                                                                          |     |     |     |      |      |      |      |
| <b>ACSW</b> |     | <b>Switch Active CRAM</b><br>This bit is used to request switching roles of the two buffers, that is, switching the active buffer role between CRAM A and CRAM B. This bit is cleared automatically when the switching process completed.<br>Default value: 0<br>0: No switching requested or switching completed<br>1: Switching is being requested                                                                                                                                                                                                                                                                                                                                                                                               |     |     |     |      |      |      |      |

### 12.1.3 Coefficient Data Formats

All mixer gain coefficients are 24-bit coefficients using a 4.20 number format. Numbers formatted as 4.20 numbers have 4 bits to the left of the binary point and 20 bits to the right of the binary point. If the most significant bit is logic 0, the number is a positive number. If the most significant bit is a logic 1, then the number is a negative number. In this case, every bit must be inverted, a 1 added to the result.

### 12.1.4 Power Down and Reset Behavior

Register values including those in the Coefficient Memory and Instruction Memory should remain when the device is put into power down mode. (PG0 Reg 0x02).

Register values in the device are reset to defaults when bit 0 or 4 of (Pg0, Reg 0x01) is set to 1. Please see the register description for more information.

## 13 Device and Documentation Support

### 13.1 Development Support

For development support, see the following:

- *PCM512x/4x EVM User's Guide* ([SLAU444](#))
- [Purepath Studio](#)

### 13.2 Documentation Support

For related documentation, see *4.2-VRMS DirectPath™, 114-dB Audio Stereo Differential-Output DAC* ([SLASE12](#)).

### 13.3 Related Links

The table below lists quick access links. Categories include technical documents, support and community resources, tools and software, and quick access to sample or buy.

**Table 134. Related Links**

| PARTS   | PRODUCT FOLDER             | SAMPLE & BUY               | TECHNICAL DOCUMENTS        | TOOLS & SOFTWARE           | SUPPORT & COMMUNITY        |
|---------|----------------------------|----------------------------|----------------------------|----------------------------|----------------------------|
| PCM5121 | <a href="#">Click here</a> | <a href="#">Click here</a> | <a href="#">Click here</a> | <a href="#">Click here</a> | <a href="#">Click here</a> |

### 13.4 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

**TI E2E™ Online Community** *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At [e2e.ti.com](#), you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

**Design Support** *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

### 13.5 Trademarks

E2E is a trademark of Texas Instruments.

System Two Cascade, Audio Precision are trademarks of Audio Precision.

All other trademarks are the property of their respective owners.

### 13.6 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

### 13.7 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

## 14 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, see the left-hand navigation.

## PACKAGING INFORMATION

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBsolete:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and

---

continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

PW (R-PDSO-G28)

PLASTIC SMALL OUTLINE

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
  - B. This drawing is subject to change without notice.
  - C. Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0,15 each side.
  - D. Body width does not include interlead flash. Interlead flash shall not exceed 0,25 each side.
  - E. Falls within JEDEC MO-153

PW (R-PDSO-G28)

PLASTIC SMALL OUTLINE

- NOTES:
- A. All linear dimensions are in millimeters.
  - B. This drawing is subject to change without notice.
  - C. Publication IPC-7351 is recommended for alternate design.
  - D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
  - E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
