

# TL07xx Low-Noise, FET-Input Operational Amplifiers

## 1 Features

- High slew rate: 20V/μs (TL07xH, typ)
- Low offset voltage: 1mV (TL07xH, typ)
- Low offset voltage drift: 2μV/°C
- Low power consumption: 940μA/ch (TL07xH, typ)
- Wide common-mode and differential voltage ranges
  - Common-mode input voltage range includes  $V_{CC+}$
- Low input bias and offset currents
- Low noise:
  - $V_n = 37\text{nV}/\sqrt{\text{Hz}}$  (typ) at  $f = 1\text{kHz}$
- Output short-circuit protection
- Low total harmonic distortion: 0.003% (typ)
- Wide supply voltage:
  - $\pm 2.25\text{V}$  to  $\pm 20\text{V}$ , 4.5V to 40V

## 2 Applications

- [Solar energy: string and central inverter](#)
- [Motor drives: ac and servo drive control and power-stage modules](#)
- [Single-phase online UPS](#)
- [Three-phase UPS](#)
- [Pro audio mixers](#)
- [Battery test equipment](#)

## 3 Description

The TL071H, TL072H, and TL074H (TL07xH) family of devices are next-generation versions of the industry-standard TL071, TL072, and TL074 (TL07x) devices. These devices provide outstanding value for cost-sensitive applications, with features including low offset (1mV, typical), high slew rate (20V/μs), and common-mode input to the positive supply.

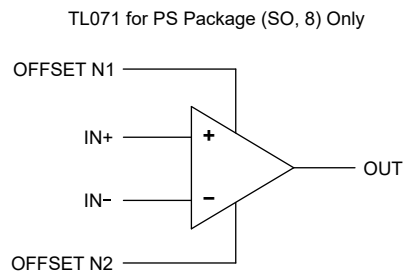

High ESD (1.5kV, HBM), integrated EMI and RF filters, and operation across the full  $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$  range enable the TL07xH devices for use in the most rugged and demanding applications.

## 5 Specifications

### Note

The TLV07xx series has transitioned new die fabrication into a modern process.

This new die is available with an H suffix.

A die with a different suffix is either older or newer; see also [Section 9.1.1](#).

[Section 5.7](#) and [Section 5.10](#) describe the performance of the new die.

[Section 5.8](#), [Section 5.9](#), and [Section 5.11](#) describe the performance of the old die.

### 5.1 Absolute Maximum Ratings

over operating ambient temperature range (unless otherwise noted)<sup>(1)</sup>

			MIN	MAX	UNIT
Supply voltage, $V_S = (V+) - (V-)$		All NS and PS packages; All TL07xM devices	−0.3	36	V
		All other devices	0	42	
Signal input pins	Common-mode voltage <sup>(2)</sup>	All NS and PS packages; All TL07xM devices	$(V_{CC-}) - 0.3$	$(V_{CC-}) + 36$	V
		All other devices	$(V_{CC-}) - 0.5$	$(V_{CC+}) + 0.5$	
	Differential voltage <sup>(2)</sup>	All NS and PS packages; All TL07xM devices <sup>(3)</sup>	$(V_{CC-}) - 0.3$	$(V_{CC-}) + 36$	V
		All other devices	$V_S + 0.2$		
	Current <sup>(2)</sup>	All NS and PS packages; All TL07xM devices	50		mA
		All other devices	−10	10	
Output short-circuit <sup>(4)</sup>			Continuous		
Operating ambient temperature, $T_A$			−55	150	°C
Junction temperature, $T_J$				150	°C
Case temperature for 60 seconds - FK package				260	°C
Lead temperature 1.8 mm (1/16 inch) from case for 10 seconds				300	°C
Storage temperature, $T_{stg}$			−65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) Input pins are diode-clamped to both power-supply rails on all new die. Current limit input signals that swing more than 0.5 V beyond the supply rails to 10 mA or less.
- (3) Differential voltage only limited by input voltage.
- (4) Short-circuit to ground, one amplifier per package.

### 5.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±2000	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	±1000	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 5.3 Recommended Operating Conditions

over operating ambient temperature range (unless otherwise noted)

			MIN	MAX	UNIT
V <sub>S</sub>	Supply voltage, (V <sub>CC+</sub> ) – (V <sub>CC–</sub> )	All NS and PS packages; All TL07xM devices <sup>(1)</sup>	10	30	V
		All other devices	4.5	40	
V <sub>I</sub>	Input voltage	All NS and PS packages; All TL07xM devices	(V <sub>CC–</sub> ) + 2	(V <sub>CC+</sub> ) + 0.1	V
		All other devices	(V <sub>CC–</sub> ) + 4	(V <sub>CC+</sub> ) + 0.1	
T <sub>A</sub>	Specified temperature <sup>(2)</sup>	TL07xM	–55	125	°C
		TL07xH	–40	125	
		TL07xI	–40	85	
		TL07xC	0	70	

(1) V<sub>CC+</sub> and V<sub>CC–</sub> are not required to be of equal magnitude, provided that the total V<sub>S</sub> ((V<sub>CC+</sub>) – (V<sub>CC–</sub>)) is between 10 V and 30 V.

(2) See also [Section 9.1.1](#).

## 7 Detailed Description

### 7.1 Overview

The TL07xH (TL071H, TL072H, and TL074H) family of devices are the next-generation versions of the industry-standard TL07x (TL071, TL072, and TL074) devices. These devices provide outstanding value for cost-sensitive applications, with features including low offset (1 mV, typical), high slew rate (20 V/ $\mu$ s, typical), and common-mode input to the positive supply. High ESD (2 kV, HBM), integrated EMI and RF filters, and operation across the full  $-40^{\circ}\text{C}$  to  $125^{\circ}\text{C}$  enable the TL07xH devices to be used in the most rugged and demanding applications.

The C-suffix devices are characterized for operation from  $0^{\circ}\text{C}$  to  $70^{\circ}\text{C}$ . The I-suffix devices are characterized for operation from  $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$ . The M-suffix devices are characterized for operation over the full military temperature range of  $-55^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$ .

### 7.2 Functional Block Diagram

### 7.3 Feature Description

The TL07xH family of devices improve many specifications as compared to the industry-standard TL07x family. Several comparisons of key specifications between these families are included in the following sections to show the advantages of the TL07xH family.

#### 7.3.1 Total Harmonic Distortion

Harmonic distortions to an audio signal are created by electronic components in a circuit. Total harmonic distortion (THD) is a measure of harmonic distortions accumulated by a signal in an audio system. These devices have a very low THD of 0.003% meaning that the TL07x device adds little harmonic distortion when used in audio signal applications.

#### 7.3.2 Slew Rate

The slew rate is the rate at which an operational amplifier can change the output when there is a change on the input. These devices have a 20-V/ $\mu$ s slew rate.

### 7.4 Device Functional Modes

These devices are powered on when the supply is connected. These devices can be operated as a single-supply operational amplifier or dual-supply amplifier depending on the application.

## 8 Application and Implementation

### Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

### 8.1 Application Information

A typical application for an operational amplifier is an inverting amplifier. This amplifier takes a positive voltage on the input, and makes the voltage a negative voltage. In the same manner, the amplifier makes negative voltages positive.

### 8.2 Typical Applications

#### 8.2.1 Inverting Amplifier

Figure 8-1. Inverting Amplifier

##### 8.2.1.1 Design Requirements

The supply voltage must be selected so the supply voltage is larger than the input voltage range and output range. For instance, this application scales a signal of  $\pm 0.5$  V to  $\pm 1.8$  V. Setting the supply at  $\pm 12$  V is sufficient to accommodate this application.

##### 8.2.1.2 Detailed Design Procedure

Determine the gain required by the inverting amplifier:

$$A_V = \frac{V_{OUT}}{V_{IN}} \quad (1)$$

$$A_V = \frac{1.8}{-0.5} = -3.6 \quad (2)$$

After the desired gain is determined, select a value for  $R_I$  or  $R_F$ . Selecting a value in the kilohm range is desirable because the amplifier circuit uses currents in the milliamp range. This example uses 10 k $\Omega$  for  $R_I$ , which means 36 k $\Omega$  is used for  $R_F$ . The gain is determined by [Equation 3](#).

$$A_V = -\frac{R_F}{R_I} \quad (3)$$

### 8.2.1.3 Application Curve

**Figure 8-2. Input and Output Voltages of the Inverting Amplifier**

## 8.3 Power Supply Recommendations

### CAUTION

Supply voltages larger than 36 V for a single-supply or outside the range of  $\pm 18$  V for a dual-supply can permanently damage the device (see [Section 5.1](#)).

Place 0.1- $\mu$ F bypass capacitors close to the power-supply pins to reduce errors coupling in from noisy or high-impedance power supplies. For more detailed information on bypass capacitor placement, see [Section 8.4](#).

## 8.4 Layout

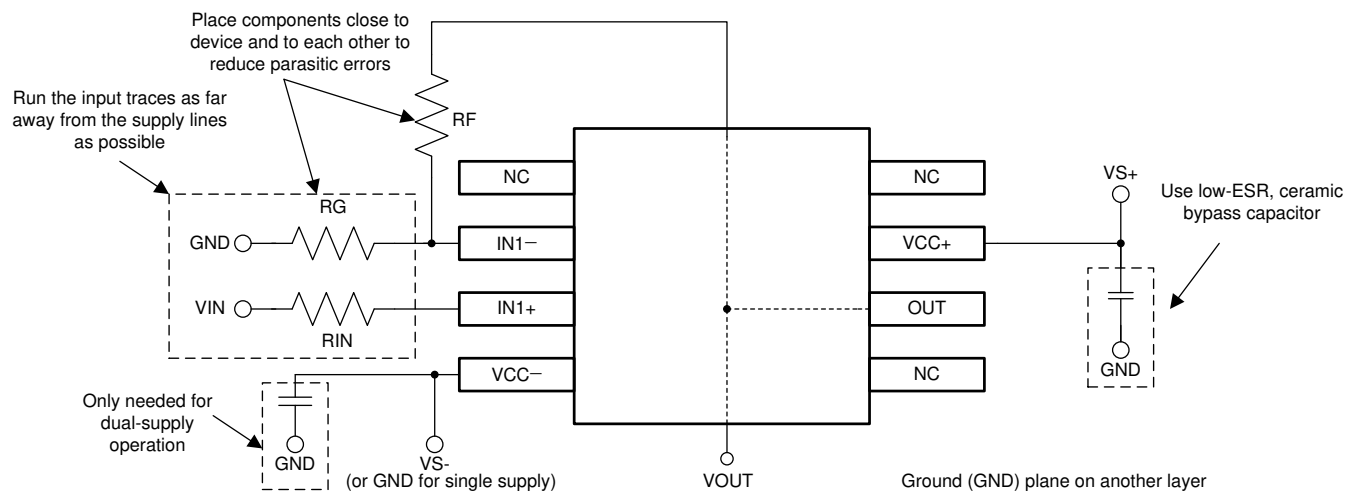

### 8.4.1 Layout Guidelines

For best operational performance of the device, use good PCB layout practices, including:

- Noise can propagate into analog circuitry through the power pins of the circuit as a whole, as well as the operational amplifier. Bypass capacitors are used to reduce the coupled noise by providing low impedance power sources local to the analog circuitry.
  - Connect low-ESR, 0.1- $\mu$ F ceramic bypass capacitors between each supply pin and ground, placed as close to the device as possible. A single bypass capacitor from  $V_{CC+}$  to ground is applicable for single-supply applications.
- Separate grounding for analog and digital portions of circuitry is one of the simplest and most-effective methods of noise suppression. One or more layers on multilayer PCBs are typically devoted to ground planes. A ground plane helps distribute heat and reduces EMI noise pickup. Take care to physically separate digital and analog grounds, paying attention to the flow of the ground current.
- To reduce parasitic coupling, run the input traces as far away from the supply or output traces as possible. If not possible, then better to cross the sensitive trace perpendicular as opposed to in parallel with the noisy trace.
- Place the external components as close to the device as possible. Keeping RF and RG close to the inverting input minimizes parasitic capacitance; see also [Section 8.4.2](#).
- Keep the length of input traces as short as possible. Always remember that the input traces are the most sensitive part of the circuit.
- Consider a driven, low-impedance guard ring around the critical traces. A guard ring can significantly reduce leakage currents from nearby traces that are at different potentials.

## 9 Device and Documentation Support

### 9.1 Device Support

#### 9.1.1 Device Nomenclature

**Table 9-1. Device Nomenclature**

PART NUMBER	DEFINITION
TL07xyzzzzzz	x is the channel count
	If y = H, the die is manufactured on the latest flow (CSO: RFB). Section 5.7 and Section 5.10 describe the performance of the new die.
	If y ≠ H and y ≠ M, the die is manufactured on the legacy flow (CSO: SFAB) or the latest flow (CSO: RFB). Section 5.8, Section 5.9, and Section 5.11 describe the performance of the original die. Section 5.7 and Section 5.10 describe the performance of the new die.
	If y = M, the device is specified for the extended temperature range of –55°C to +125°C. The die is manufactured on the legacy flow (CSO:SFAB). The letters and numbers represented by z are grade-out and package options described in Section 5.8 and the <i>Package Option Addendum</i> at the end of this data sheet.

### 9.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

<sup>(1)</sup> **Status:** For more details on status, see our [product life cycle](#).

<sup>(2)</sup> **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

<sup>(3)</sup> **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

<sup>(4)</sup> **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

<sup>(5)</sup> **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

<sup>(6)</sup> **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
